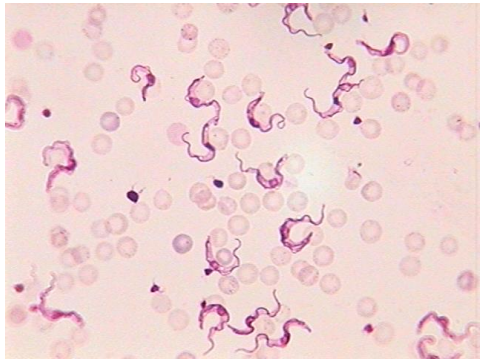
Epidemiologija i značaj parazitarnih infekcija
Principi pravilnog skupljanja, transporta i obrade uzoraka za parazitološku dijagnostiku
Reagensi, bojenja i mediji u parazitologiji

Paraziti

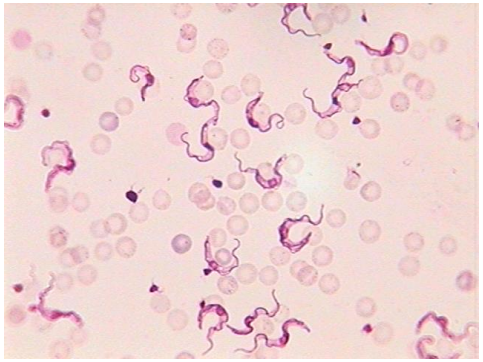
- Parazit - organizam čiji život u potpunosti ovisi o drugom živom biću (domaćinu)
- Parazitizam - biološka asocijacija u kojoj parazit ima koristi, a domaćin biva iskorišten
- Obligatni parazit - za održanje života mora biti uvijek u kontaktu sa svojim domaćinom
- Slobodno-živući parazit - može postojati i samostalno



Bogitsh BJ, Carter CE, Oeltmann TN. Human Parasitology. 3. izd. Burlington: Elsevier; 2005.

Paraziti

- Domaćin - konačni ili prijelazni
- Konačni domaćin -spolno razmnožavanje parazita, najrazvijeniji oblik parazita
- Prijelazni domaćin - nespolni ili larvalni oblici parazita
- Neki paraziti za svoj kompletni razvoj trebaju jednog, a neki i više prijelaznih domaćina



Bogitsh BJ, Carter CE, Oeltmann TN. Human Parasitology. 3. izd. Burlington: Elsevier; 2005.

Paraziti

Jednostanični

- Protozoi
- Mikrosporidije

Višestanični

Helminti - crvi

- Valjkasti crvi
- Plosnati crvi metilji i trakavice

Člankonošci

Humana parazitologija

- 200 vrsta helminta
- 80 vrsta jednostaničnih parazita
- Artropoda - ?

Abstract

We present four cases in which probable sexual transmission of Giardia lamblia was suspected. Diagnosing this mode of transmission in endemic areas is often difficult and should be considered only as possible, because exposure to poor sanitation and a potentially contaminated environment are always latent. However, as patients reported, there was no history of drinking tap water, exposure to recreational water, eating contaminated food, or other potential sources of infection but anilingus with an infected partner. We consider that in endemic countries, even when other more frequent modes of transmission could be playing the main role, the possibility of (re)infection due to sexual transmission should not be forgotten. Talking openly with patients, strengthening patient-specific preventive measures and counselling appear to be needed to reduce risks of Giardia infection transmission due to this often neglected route.

Skupljanje uzoraka, transport i obrada

- Rutinska parazitološka dijagnostika – procedure za detekciju parazita u kliničkim uzorcima na osnovi morfoloških kriterija
- Svjetlosni mikroskop – mikroskopija nativnih, koncentriranih ili obojenih preparata
- Kultivacija, detekcija antigena, detekcija nukleinske kiseline, elektronska mikroskopija, serološka dijagnostika

Skupljanje uzoraka, transport i obrada

- Jedan od najznačajnijih preduvjeta za točnu i pouzdanu dijagnostiku – adekvatno sakupljen, obrađen i pregledan uzorak
- Uzorak – životni ciklus parazita!!!
- Laboratorij – striktni kriteriji za prijem i odbijanje uzoraka
- Uzorci – potencijalno infektivni – mjere predostrožnosti

Skupljanje uzoraka, transport i obrada

Stolica

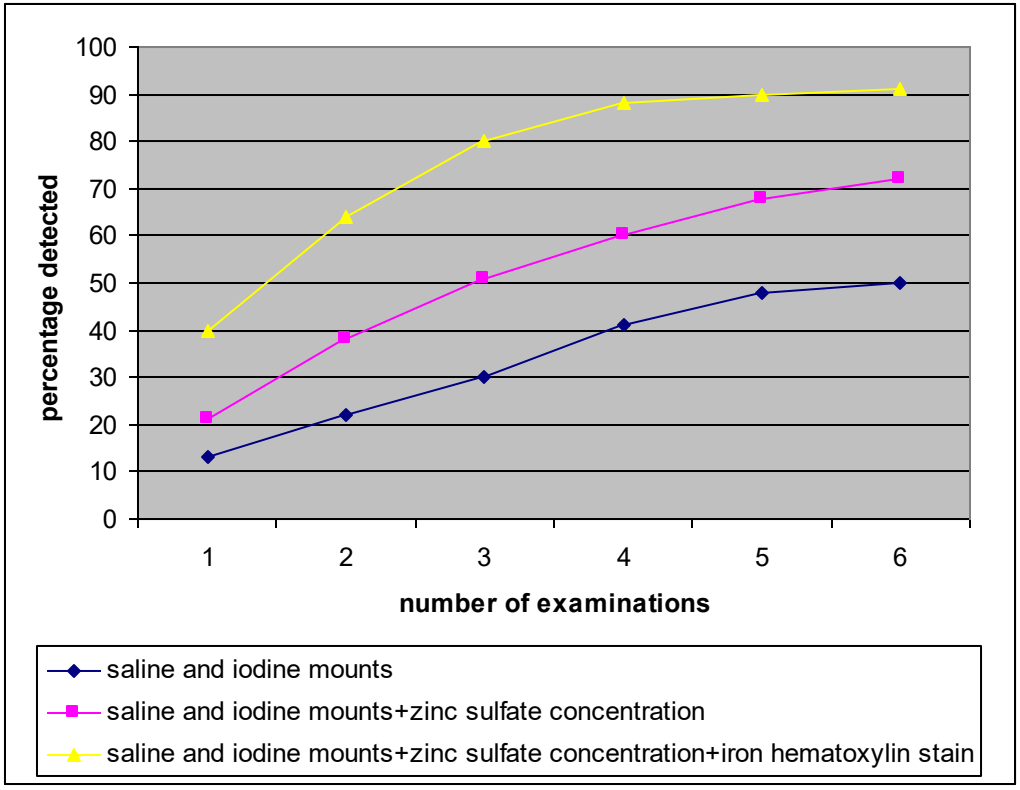
- Barijeva kaša, mineralno ulje, bizmut, antibiotici, antimalarijski ljekovi – do nekoliko tjedana stolica negativna!
- Upozorenje: “Pojedini antibiotici (metronidazol, tetraciklini) mogu utjecati na detekciju parazita iz uzorka stolice”
- Posudica – čista, širokog grla, adekvatnog poklopca, bez vode ili urina

Skupljanje uzoraka, transport i obrada

Stolica

- Uzorak – ime i prezime, identifikacijski broj, ime liječnika, datum i vrijeme skupljanja uzorka
- Uputnica – naziv pretrage koja se traži, epidemiološki podaci (putovanja)

Skupljanje uzoraka, transport i obrada



Skupljanje uzoraka, transport i obrada

Stolica

- Preporuke
- Serija od tri uzorka stolice
- Svaki drugi dan, ne više od 10 dana
- Ne svaki dan!!!
- Nakon terapije
- Tri uzorka stolice
- 1-2 tjedna nakon završetka terapije kod infekcije protistima, 3-4 tjedana nakon završetka terapije helmintnih infekcija

Skupljanje uzoraka, transport i obrada

Stolica

- Svježa stolica, proljevasta stolica – trofozoiti
- Pregled unutar pola sata
- Jaja, ličinke, kokcidije, mikrosporidije – nisu jako osjetljivi – pregled unutar jednog dana - frižider
- Primjena fiksativa
- Detekcija antigena – pregled unutar 24 sata, ledenica spremanje više od jednog dana

Skupljanje uzoraka, transport i obrada

Stolica

- Fiksativi
- Čuvanje morfologije parazita i sprječavanje daljnjeg razvoja jaja i ličinki
- Direktno stavljanje stolice u bočicu sa fiksativom ili naknadno doljevanje fiksativa
- Adekvatno mješanje
- Interferencija – detekcija antigena, molekularne metode

Skupljanje uzoraka, transport i obrada

Stolica - fiksativi

- Formalin – 5, 10 %
- Neutralni puferirani formalin
- Zagrijani formalin 60 stupnjeva – Taenia
- SAF
- Shaudinn
- PVA

Skupljanje uzoraka, transport i obrada

Krv

- Plasmodium, Babesia, Trypanosoma, Leishmania, Toxoplasma, mikrofilarije
- Puna krv, buffy coat, koncentrati, krvni razmazi, gusta kap
- Razmaz, gusta kap – svježa krv, krv s antikoagulansom (EDTA), koncentrati
- Vrijeme uzimanja krvi!!!
- Hitne pretrage – javljanje direktno kliničaru svakog pozitivnog nalaza

Skupljanje uzoraka, transport i obrada

Krv

- Imunodijagnostika - detekcija protutijela
- Serum – spremanje do tjedan dana na +4˚C ili kod dužeg spremanja na -20˚C
- Transport seruma na temperaturi okoline (put‹1 tjedan; temperatura okoline‹30˚C)
- Ako je nužna usporedba dva seruma – istovremeno testiranje oba seruma
- Testiranje likvora/očne vodice + seruma – uzorci uzeti isti dan i testirani isti dan

Skupljanje uzoraka, transport i obrada

Ostali uzorci

- Duodenalni sok
- Sputum
- Bioptati
- Punktati
- Amnionska tekućina
- Uzorci urogenitalnog sustava

Reagensi, mediji i bojenja

- Kultivacija – ograničeno primjenljiva u parazitologiji
- Mikroskopija - nezamjenjiva
- Nativni preparat – živi organizam
- Priprema, bojenje preparata, čuvanje – reagensi, mediji, boje
- Laboratorij – odabir, dobra laboratorijska praksa, tržište
- Toksičnost (formalin, živini spojevi, fenol, ksilen)

Reagensi, mediji i bojenja

Formalin

- Česta upotreba (čuvanje, za koncentracijske metode)
- Dobro čuva morfologiju jaja, ličinki, cisti, oocisti i spora
- Dugo čuvanje moguće
- 5% protisti, 10% jaja

Rcp (10%)

- Formaldehid 37-40% .....100 ml
- 0,85% NaCL ili destilirana voda.. 900 ml

Reagensi, mediji i bojenja

Puferirani formaldehid

- Za dugotrajno spremanje i čuvanje morfologije organizama
- Sadrži fosfatne soli natrija i kalija
- Rcp
- Na2HPO4.....6.1 g
- KH2PO.....0,15 g
- 0,8 g ad 1 L 10% ili 5% formalina

Reagensi, mediji i bojenja

Merthiolate-jod-formalin (MIF)

- Fiksacija
- Bojenje
- Dvije otopine – svježa otopina
- Komercijalno dostupan

Reagensi, mediji i bojenja

PVA

- Adheziv – omogućuje stolici da prione za predmetno stakalce – izrada preparata

Schaudinn otopina/fiksativ

- Sadrži živu, izbjegava se

Sodium acetate-acetic acid-formalin (SAF)

- Fiksativ, ne sadrži živu
- Za koncentracijske metode i za pripremu trajno bojenih preparata
- Komercijalno dostupan
- Rcp

Natrij acetat.....1,5 g

Ledena octena kiselina.....2.0 ml

Formaldehid (37-40%).....4.0 ml

Destilirana voda.....92.0 ml

Reagensi, mediji i bojenja

Otopina joda

- Priprema preparata – dodatak nativnom preparatu, koncentracijske metode
- Nespecifična boja, diferencija parazita od okolnih struktura (ciste, jaja i ličinke zadržavaju boju i postaju svjetlo smeđi)
- Na tamnom, ograničen rok trajanja (posvijetli stajanjem)
- Rcp – 1 kap na stakalce s fecesom, lagano pomješati, pokrovnica

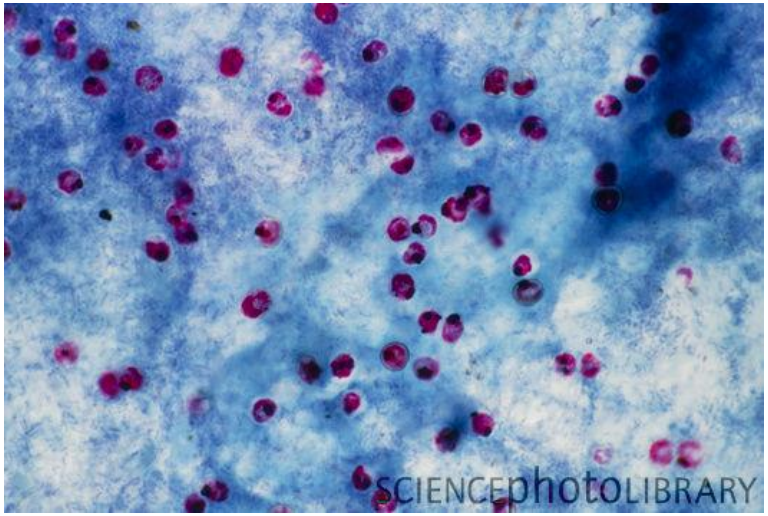
Reagensi, mediji i bojenja

Acid fast stain

- Cryptosporidium, Isospora, Cyclospora

Modificirana Ziehel Neelsen metoda

- “Deblji preparat”, sušenje
- Metanol fiksacija -1 min
- Karbol fuksin – 15-20 min
- 3% HCL u alkoholu 10-15 sek.
- Ispiranje vodom
- Metilensko modrilo – 3 min
- Ispiranje vodom

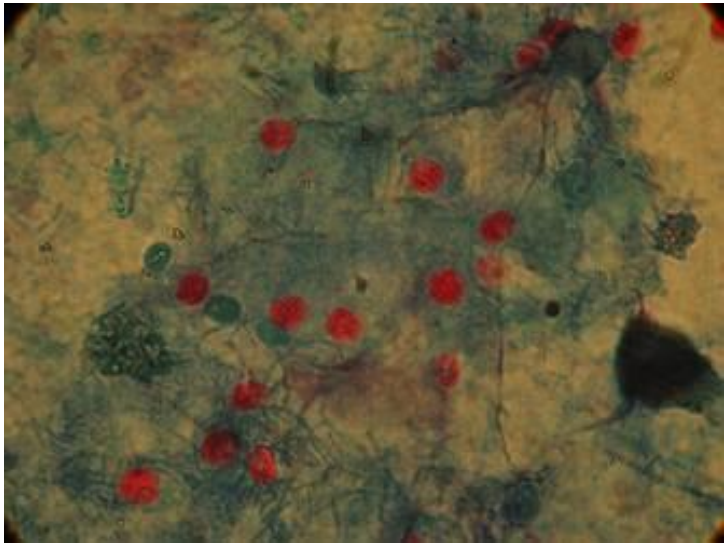


Reagensi, mediji i bojenja

Acid fast stain

Kinyoun

- 1-2 kapi uzorka stolice
- Sušenje, fiksacija metanolom 1 min
- Karbol fuksin 5 min
- 50% etanol ispiranje, voda
- H_2SO_4 1% 2 min
- Metilensko modrilo 1 min
- Ispiranje voda



Reagensi, mediji i bojenja

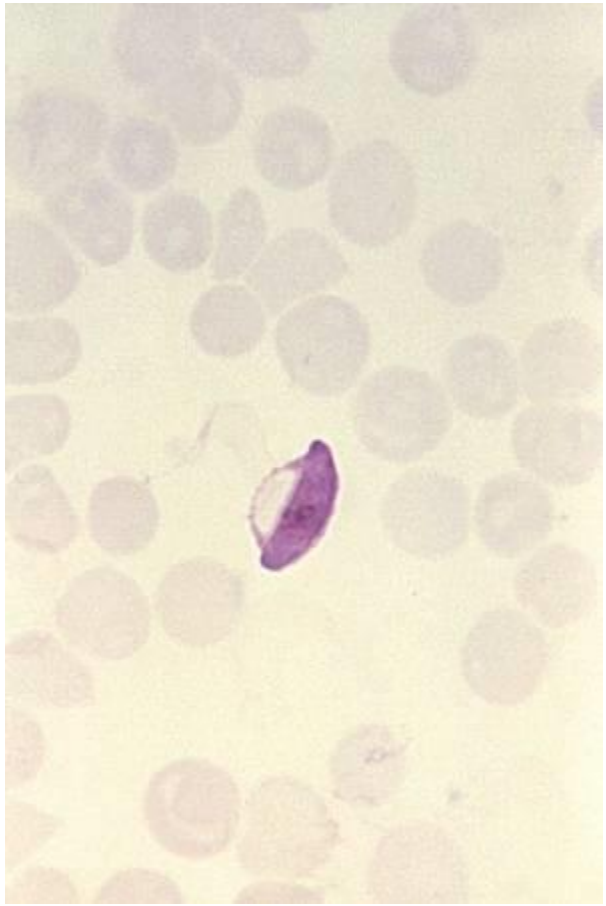
Bojenje krvno tkivnih preparata

Malarija, mikrofilarije, Leishmania, babesia, Trypanosoma

- Giemsa, Wright
- Giemsa ne sadrži fiksativ
- Giemsa superiornija za gustu kap

Postupak – krvni razmaz

- Metanol – 1 min
- Otopina Giemse -30-45 min
- Ispiranje vodom



Reagensi, mediji i bojenja

Bojenje krvno tkivnih preparata

- Bojenje hematoksilinom (Delafield)
- Mikrofilarije – bolje prikazuje detalje ovojnice

Reagensi, mediji i bojenja

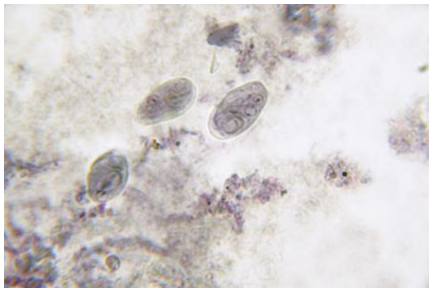
Željezni hematoksilin

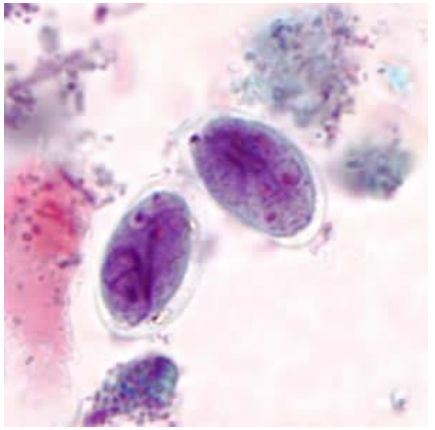
Trikrom bojenje

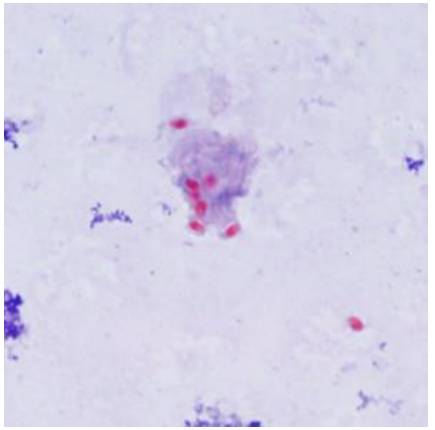
- Za protiste probavnog sustava

Modificirani trikrom

- Za mikrosporidije







Reagensi, mediji i bojenja

Mediji

- Acanthamoeba
- Naegleria
- Amebe probavnog sustava
- Trichomonas
- Leishmania
- Trypanosoma

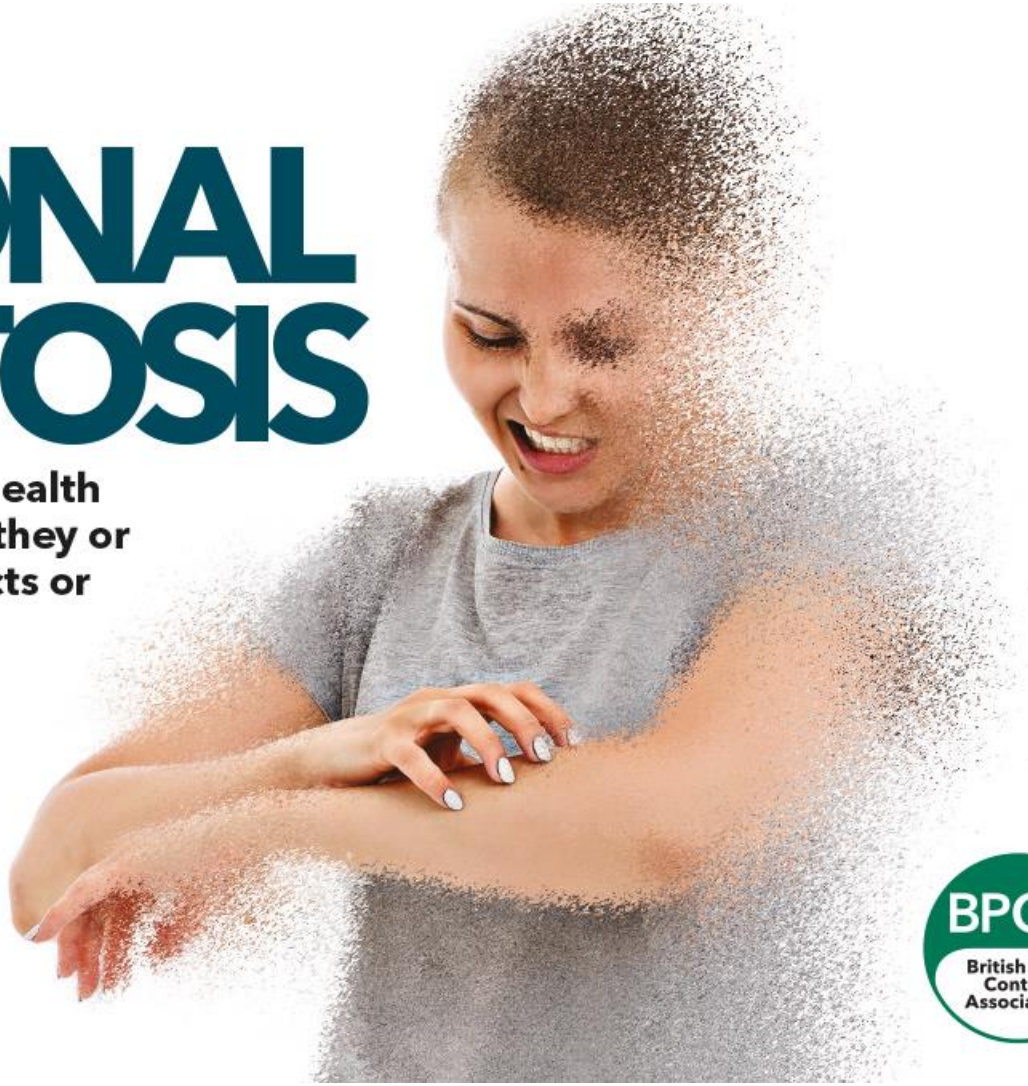
PESTWATCH:

DELUSIONAL PARASITOSIS

Delusional parasitosis is a mental health condition in which people believe they or their homes are infested with insects or parasites

– includes reference to self-harm



BPCA
British Pest Control Association

Epidemiology

American continent – prevalence is 1 – 1.9 per 100,000 person-years

Europe - **prevalence** around 80 cases per million

World-wide: **incidence** (between 1.9 and 3.7 cases per 100,000); **prevalence** (27.3 per 100,000 person-years)

Treatment

First line treatment – antipsychotics

The first antipsychotic medication used to treat DP was **pimozide.**

Atypical antipsychotics can be considered: **olanzapine**, **risperidone**, **paliperidone**, **aripiprazole**

Anti-parasitic treatment is not required and may maintain and encourage the patients delusions

Additional psychotherapy methods: cognitive and behavior therapy

Pathophysiology

Dopaminergic system imbalances specific neuroanatomical changes:

1. cortical and/ or subcortical atrophy;
2. striatum and putamen lesions, basal ganglia damages;
3. poor vascularization of temporal-parietal and fronto-temporal areas;
4. dopamine transporter system dysfunction

Diagnosis

No standard mental state examination to facilitate the diagnostic

Comparable as a diagnostic with delusional disorder (somatic type) according to DSM V and ICD 10

No conclusive evidence that certain changes in **computed tomography or magnetic resonance imaging** are specific for DP patients

Delusional parasitosis (DP)/infestation

BRZA PONUDA ~~78 €~~ 20 €

NARUČITE SADA

Uklonite parazite prirodnim putem uz PARAZOL

Parazol je prirodan pripravak na bazi biljnih ekstrakata koji pomaže u uklanjanju parazita i toksina, pridonoseći boljoj probavi, jačem imunitetu i općem osjećaju dobrobiti — bez agresivnih kemikalija.

- Pomaže u borbi protiv parazita i podržava prirodne procese detoksikacije organizma.
- 100% prirodni sastojci, na bazi biljnih ekstrakata.
- Doprinosi smanjenju nadutosti i poboljšanju probave već u prvim danima korištenja.
- Podržava jačanje imunološkog sustava.
- Sigurno za kontinuiranu upotrebu, s blagom i prirodnom formulom.

LIJEČNIČKI PREGLED

ZORAN DRAGIČEVIĆ

SPECIJALIZACIJA: PARAZITOLOG

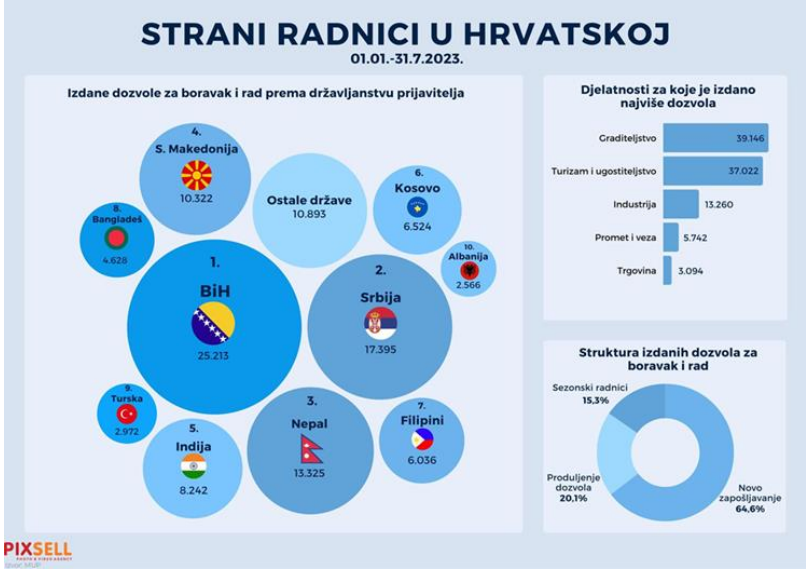
ISKUSTVO: 8 GODINA

Svi parazitolozi u Hrvatskoj znaju: ako imate tumore na tijelu, onda se isplati provjeriti prisutnost helminta. Često njihove štetne aktivnosti dovode do oštrog pada imuniteta, zbog čega ljudski papiloma virus dobiva potpunu slobodu. Dobro je što se ova sumnjiva veza lako može prekinuti jednim udarcem. Kapsule Toxic OFF nedavno su postale poznate na tržištu lijekova protiv glista, ali su već stekle dobru reputaciju zbog svoje učinkovitosti i prirodnog sastava. Oni neće naštetiti vašem zdravlju i oslobodit će se ne samo parazita, već i papiloma.

Algoritmi za detekciju i identifikaciju parazita
Dijagnostičke metode u parazitologiji

- Mikroskopija i danas najčešće upotrebljavanija dijagnostička metoda u parazitologiji – znanje i vještine laboratorijskog osoblja

Algoritmi za detekciju i identifikaciju parazita
Dijagnostičke metode u parazitologiji



- Mikroskopija i danas najčešće upotrebljavanija dijagnostička metoda u parazitologiji – znanje i vještine laboratorijskog osoblja
- Izazov

-putovanja (službena, turistička)

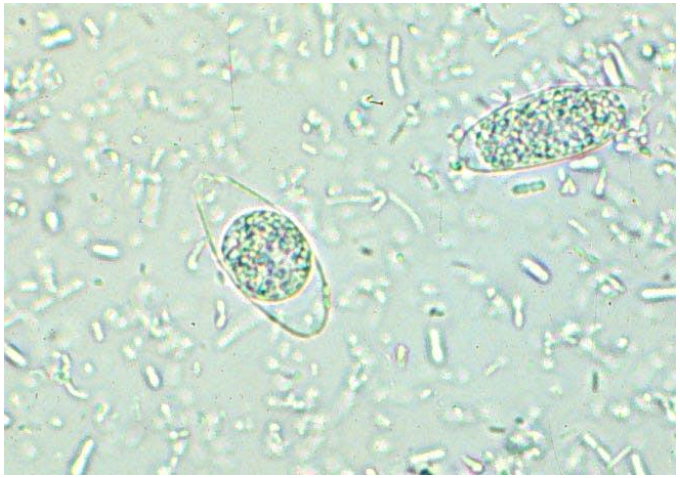
-imunodeficijentni pacijenti – širi dijapazon parazitarnih organizama

-migracije radnika, migranata

Parazitološke pretrage stolice

Mikroskopija - nativni preparat

- Skrining
- Procjena gustoće parazita, pokretljivost parazita
- Svježa stolica, ne iz frižidera, stigla u laboratoriju u adekvatnom vremenu
- Nativni preparat posebno važan za proljevaste stolice
- 100 i 400 suho povećanje mikroskopa
- Rezultat – preliminaran



Parazitološke pretrage stolice

Mikroskopija – koncentracijske metode

- Sedimentacijske i flotacijske
- Odvajanje fekalnih elemenata od parazita
- Sedimentacijske – preparat sadrži više debrisa
- Flotacijske – teža jajašca i ličinke ne isplivaju na površinu, parazitarni elementi infektivni

- MIFC
- Metoda flotacije s kuhinjskom soli
- Metoda flotacije s otopinom cinkova sulfata

Parazitološke pretrage stolice

Mikroskopija – MIFC (Merthiolate-Iodine-Formaldehyde-Concentration)
Najjednostavnija metoda za izvođenje

- *MF OTOPINA (OTOPINA I)*

Tct. Merthiolate 1:1000	200,0 ml
Formaldehid	25,0 ml
Glicerin	5,0 ml
Destilirana voda	250,0 ml

- *LUGOLOVA OTOPINA (OTOPINA II)*

Iodum resublimatum	5.0 g
Kalii iodatum (KJ)	10,0 g
Destilirana voda	100,0 ml

Otopine čuvati u smeđoj staklenoj boci sa čepom.
Rok trajanja do 1 godine.

+ Eter ili etil acetat

Parazitološke pretrage stolice

MIF OTOPINA

- Pred samu upotrebu izmiješa se 7,0 ml. otopine I i 0,5 ml otopine II po jednoj stolici

Postupak:

- 1 - 1,5 g svježe stolice (veličine zrna graška) izmiješati - homogenizirati sa 7 ml MIF otopine u prikladnoj posudici
- Dobivenu mješavinu procijediti kroz jedan sloj gaze u koničnu epruvetu
- Dodati u epruvetu 2,0 ml. etera (ili etil acetata), zatvoriti epruvetu gumenim čepom i snažno protresti
- Odčepiti epruvetu i ostaviti da odstoji 2 - 3 minute
- Centrifugirati 10 min. na 1600 - 2000 okretaja u min.
- Poslije centrifugiranja mješavina u epruveti se razdvoji na četiri sloja (eter na površini, sloj detritusa, sloj MIF-a, sediment)

Parazitološke pretrage stolice

- Osloboditi gusti sloj detritusa od stijenki epruvete kružnim pokretom metalnog ili staklenog štapića.
- Brzo ali oprezno dekantirati.
- Preostali sediment pomiješati sa malo tekućine koja se nacijedila po stijenki epruvete nakon dekantacije. Jednu kap sedimenta pomoću pipete prenijeti na predmetno stakalce i staviti pokrovno stakalce veličine 20 X 20 mm.
- Mikroskopirati cijeli preparat pod povećanjem objektiva 40x.

Komercijalni fekalni koncentratori

Advantages

•**Enhanced Biosafety:** Being enclosed, one-tube systems, they drastically minimize user exposure to infectious fecal matter and reduced odor

•**Reduced Risk from Reagents:** These kits often allow the use of safer, less flammable, or "solvent-free" alternatives to the traditional, dangerous, diethyl ether used in manual methods

•**Efficiency and Speed:** They simplify the process of filtration and sedimentation, reducing labor-intensive steps and technical errors

•**High Diagnostic Accuracy:** Studies indicate they produce clearer sediments with less debris than conventional methods, and demonstrate high sensitivity for detecting a wide range of parasites, sometimes surpassing the Kato-Katz method

•**Ease of Use:** They are often preferred for field studies and in remote laboratories because they are simple, self-contained, and facilitate quick testing

Disadvantages

•**Cost:** As disposable, single-use kits, they are significantly more expensive than conventional "homemade" concentration methods

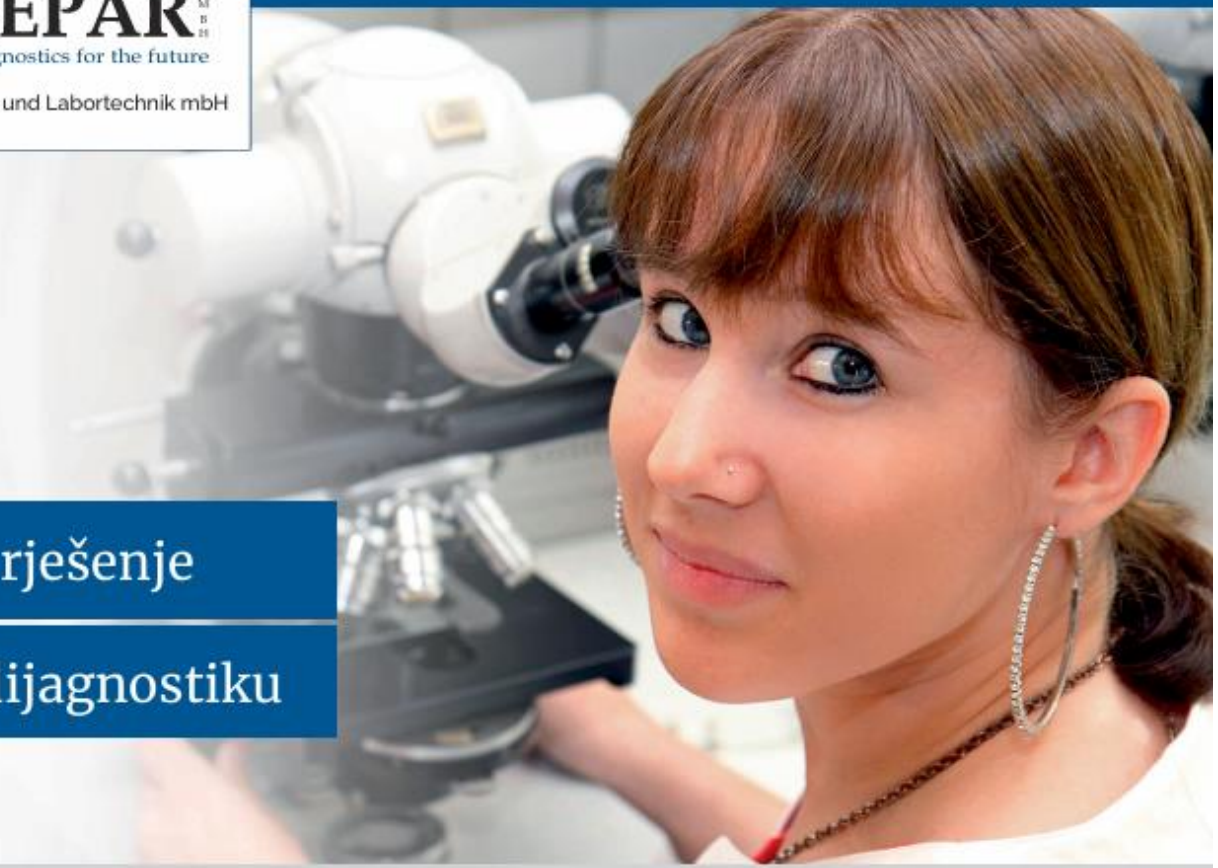
•**Variable Sensitivity:** While usually good, some studies suggest that in low-intensity infections, some commercial kits might exhibit lower sensitivity compared to formal-ethyl acetate sedimentation

•**Potential for Lower Recovery Rates:** In some studies, commercial systems—particularly "solvent-free" kits—have shown lower efficiency in recovering certain ova (e.g., *Taenia* spp.) compared to traditional methods

•**Sediment Size:** Some users report that solvent-free, commercial products can produce a larger amount of debris in the final sediment compared to original solvent-based methods

BIO SEPAR GMBH
Diagnostics for the future

Gesellschaft für Medizin- und Labortechnik mbH

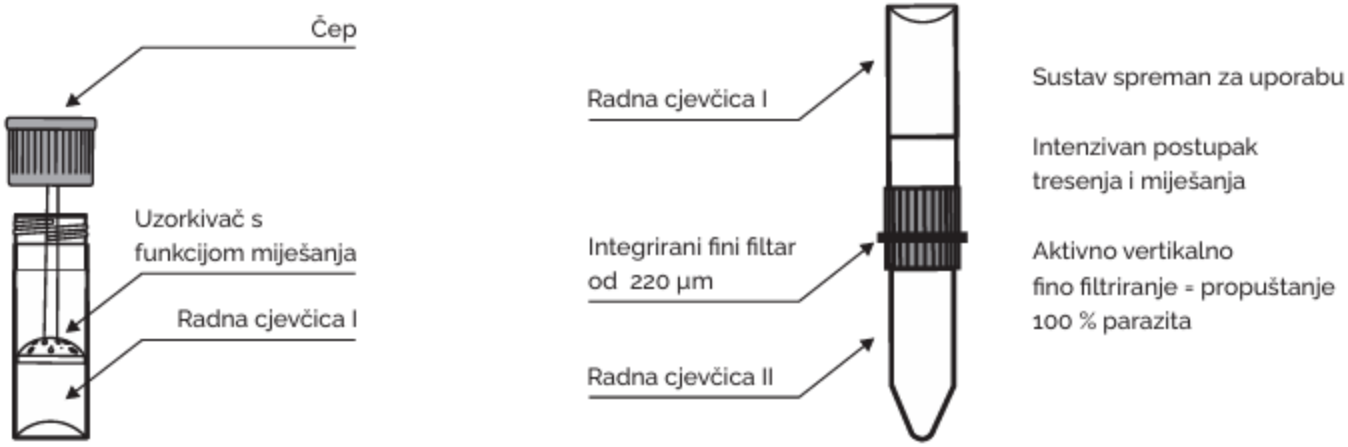


Najbolje rješenje za vašu dijagnostiku

Parazitološka dijagnostika stolice

Dijagnostički sustav Biosepar ParasiTrap® rezultat je dugogodišnjeg istraživačkog i razvojnog rada u Institutu za medicinsku mikrobiologiju i higijenu Max von Pettenkofer Sveučilišta Ludwig-Maximilians-Universität München. Razvijen je da bi se neugodan i rizičan postupak laboratorijske obrade stolice olakšao, učinio sigurnijim i ekološki prihvatljivijim te kako bi se stopa pogodaka trajno optimizirala.

Struktura sustava ParasiTrap®



Dijagnostika ParasiTrap® omogućuje vam izbor između postupaka sedimentacije i flotacije.

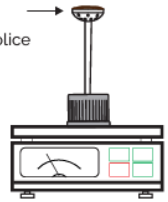
Sedimentacija	Flotacija**
Nenapunjeni sustav*	Napunjen s BioFlot PLUS Medium
Napunjen s 4 ml Medium A ECO (bez formalina)	Napunjen s medijem magnesijeve soli
Napunjen s 4 ml Medium A AF (6 % formalina)	Napunjen s medijem cinkove soli
Napunjen s 4 ml Medium A SAF (4 % formalina)	
Napunjen s 4 ml Medium A Bailenger (bez formalina)	**Može se naručiti zasebno s postupkom sedimentacije i flotacije*
Napunjen s 4 - 4 ml Medium A DUAL	***Može se naručiti s posebnom težinom od 1,28 ili 1,30*

Jednostavni koraci za dijagnostiku (sedimentacija)

01. Priprema / uzimanje uzorka

Uvijek definirana jednaka koli ina stolice

Moguća je kvantitativna analiza

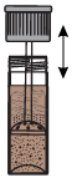


02. Obrada uzorka, I. korak

Optimalno mije anje, ak i tvrdih stolica

Bojenje parazita medijem Combi-Medium

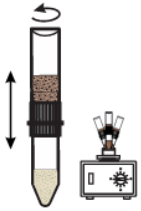
Trenutno fiksiranje (i bez formalina)



03. Obrada uzorka, II. korak

Intenzivan postupak tresenja i miješanja

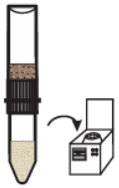
Prvo aktivno vertikalno fino filtriranje



04. Obrada uzorka, III. korak

Drugo potpuno vertikalno fino filtriranje: bez mrtvog prostora, u filtru više nema parazita

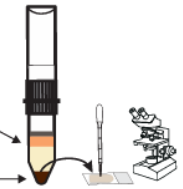
Centrifugiranje ili puštanje da odstoji 2 – 3 sata



05. Spremno za dijagnostiku

Jasno odvojeni slojevi

100 % obojeni koncentrat parazita



Više o našim proizvodima

Dijagnostički sustav Biosepar ParasiTrap® vodeći je na tržištu u pogledu mogućnosti reproduciranja rezultata, mogućnosti standardiziranja i osjetljivosti te se svakodnevno upotrebljava u brojnim laboratorijima u Njemačkoj i inozemstvu s velikim uspjehom. Racionalni radni postupak dopušta obradu i većih serija uzorkovanih materijala u kratko vrijeme, čime se može uštedjeti na dragocjenom vremenu rada. Dijagnostički sustav ParasiTrap® ispunjava sve kriterije suvremenog upravljanja kvalitetom. Izvrsna stopa pogodaka i kvaliteta mikroskopskih vidnih polja skraćuju vrijeme potrebno za mikroskopsku analizu bez ugrožavanja dijagnostičke sigurnosti.

Zahvaljujući stalnom istraživanju i razvoju sustav za ispitivanje stolice Biosepar ParasiTrap® omogućuje smislene dijagnostičke alternative u suzbijanju parazita.

Značajka	Komercijalni koncentrator	Konvencionalna metoda
Sigurnost	Visoka (zatvoreni sustav)	Niska (otvoreni sustav, aerosol)
Rad	Niski (single use)	Visoki (ručni)
Cijena	Viša	Niža
Efikasnost	Visoka	Visoka

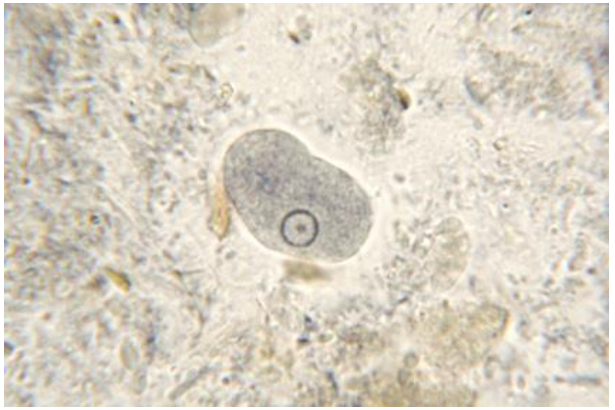
Odabir?

- **Your budget and volume of samples**
- **Available safety equipment**
- **The primary types of parasites you need to detect**

Parazitološke pretrage stolice

Mikroskopija – trajno obojeni preparati

- Trikrom
- Željezo-hematoksilin
- Dozvoljavaju pregled i uočavanje detalja morfologije parazita pod imerzijskim povećanje
- Trebalo bi pregledati minimum 300 vidnih polja
- Konačna determinacija parazita



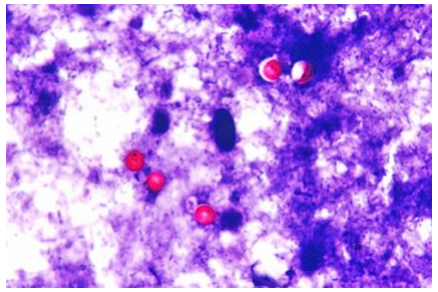
Parazitološke pretrage stolice

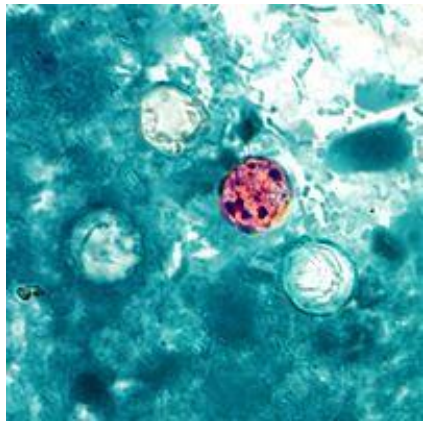
“Acid fast bojenje”

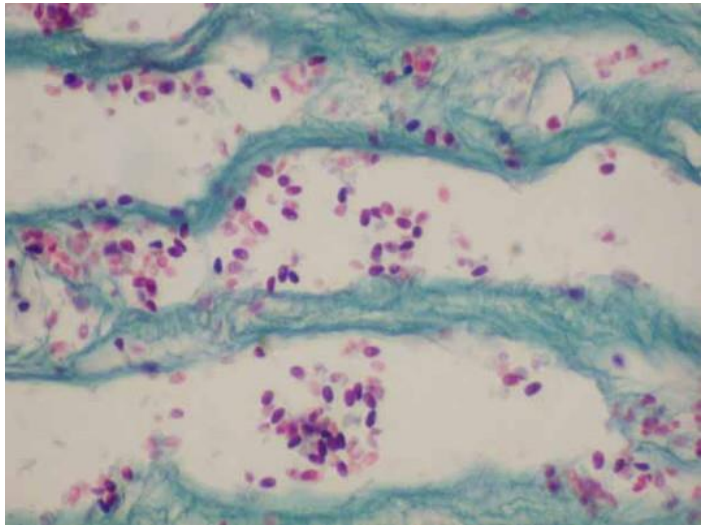
- Probavne kokcidije
- 300 imerzijskih vidnih polja

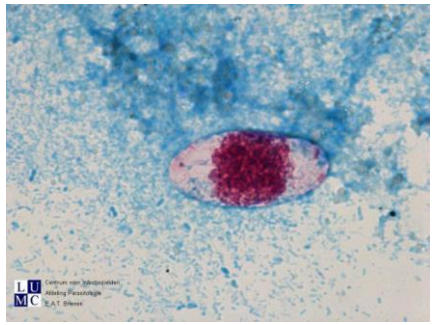
Modificirani trikrom

- Mikrosporidije









Parazitološke pretrage stolice

- Interpretacija rezultata
- Preporuka: izdavanje nalaza svih parazita, kao i izdavanje nalaza apatogenih organizama
- Praksa nije ujednačena!!!

Parazitološke pretrage stolice

Detekcija antigena

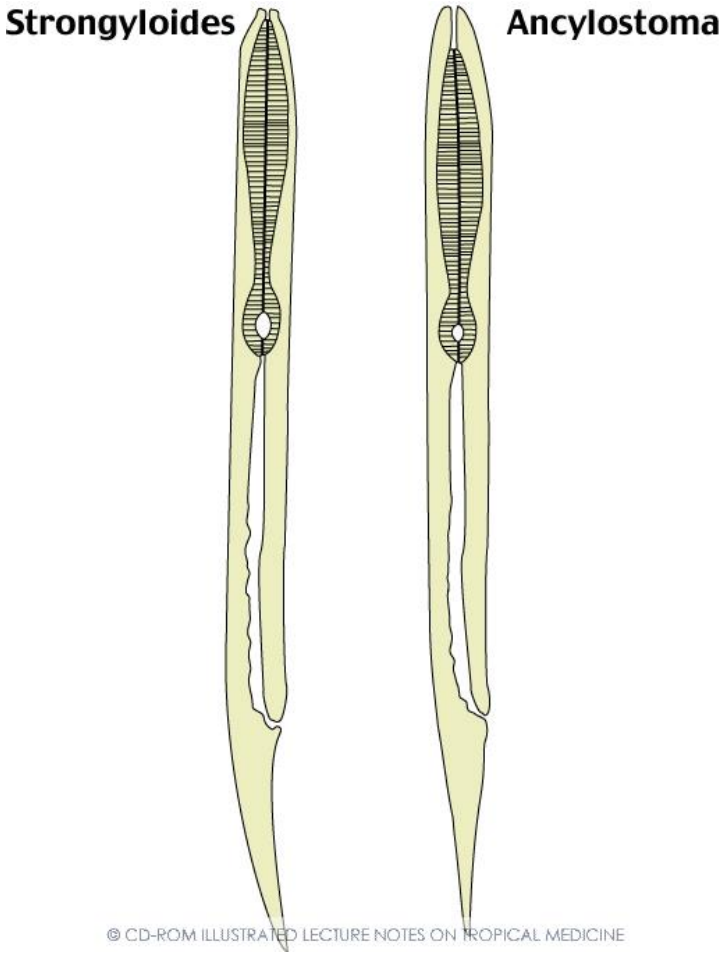
- EIA, imunokromatografska metoda, DFA
- G. lamblia
- E. histolytica/dispar; E histolytica
- Cryptosporidium sp.
- Pojedinačni, kombinirani testovi, kazete

Parazitološke pretrage stolice

Koprokultura

- Diferencijacija infekcija parazitom Ancylostoma, Strongyloides, Trichostrongylus

Parazitološke pretrage stolice

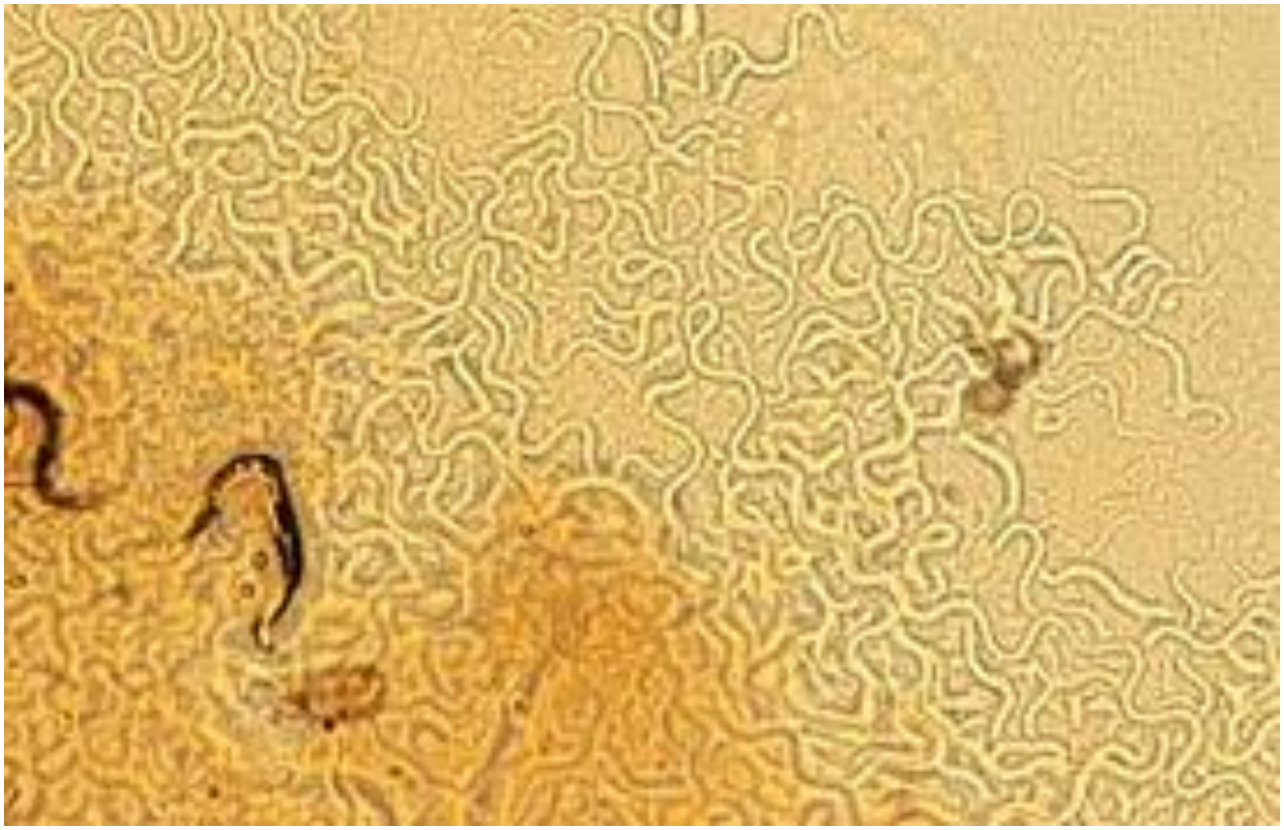


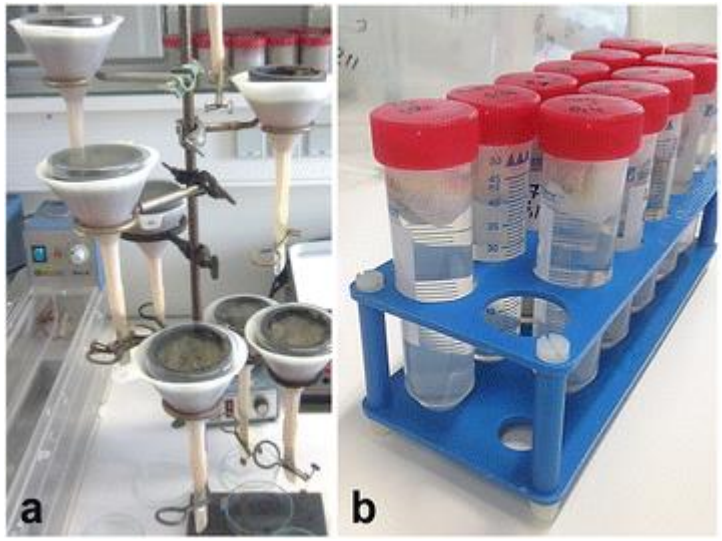
Parazitološke pretrage stolice

Koprokultura

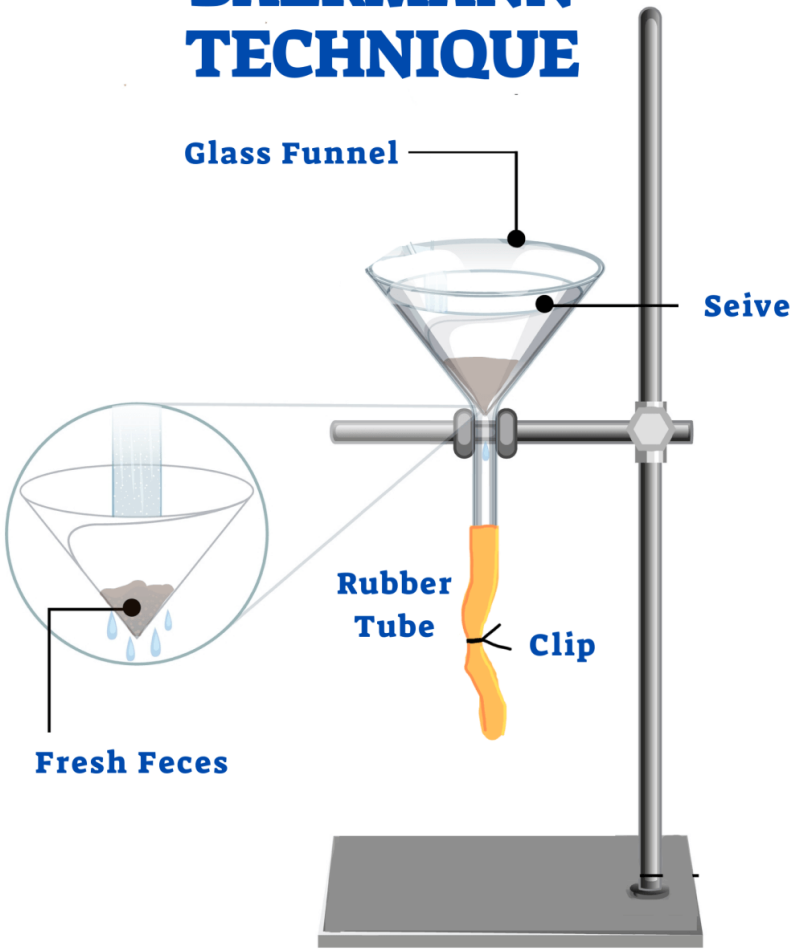
- Diferencijacija infekcija parazitom Ancylostoma, Strongyloides, Trichostrongylus

- Kultura na agaru
- Baermanova metoda
- Harada Mori filter papir metoda





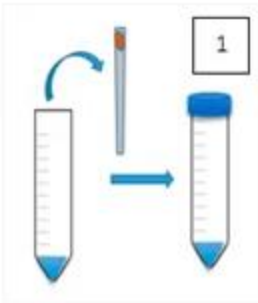
BAERMANN TECHNIQUE



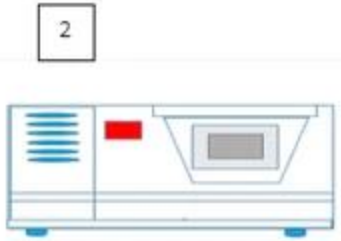
cleverorca
VETERINARY TECHNICIAN

- Baermannova metoda radi na principu aktivne migracije živih larva iz uzorka stolice u mlaku vodu, u kojoj one zbog nemogućnosti plivanja tonu na dno. Ova je metoda zlatni standard u parazitologiji za detekciju parazita Strongyloides stercoralis jer omogućuje prikupljanje čistih i neoštećenih larva bez upotrebe agresivnih kemikalija koje bi ih mogle deformirat
- koristi kombinaciju topline, vlage i gravitacije kako bi potaknuo žive parazite da sami izađu iz stolice. Larve prolaze kroz gazu u mlaku vodu, gube sposobnost održavanja na vodi i talože se na dnu aparata, odakle se jednostavno uzimaju za mikroskopsku dijagnostiku

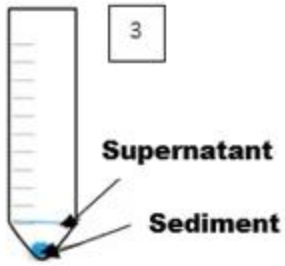
Filter paper strip with stool sample



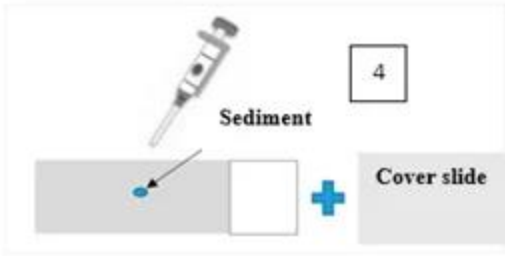
Remove the strip and close the tube



Centrifuge the sample at 1500 rpm for 2 minutes



Discard the supernatant



Using a pipette, remove the sediment, place it on a slide and re – cover it with a cover glass.

Read the slide with the 10x power objective of the microscope

- Harada-Mori metoda je jednostavna i jeftina laboratorijska tehnika uzgoja (kulture) koja se koristi za otkrivanje i koncentraciju ličinki parazita u stolici, prvenstveno za Strongyloides stercoralis

1. **Nanošenje uzorka**: Oko 0,5 do 1 gram svježe stolice razmaže se po sredini uske trake filter papira. Krajevi papira ostavljaju se čistima

2. **Postavljanje u epruvetu**: Filter papir se umeće u epruvetu u kojoj se nalazi nekoliko mililitara destilirane ili obične vode

3. **Kontakt s vodom**: Papir se postavlja tako da njegov donji, suženi dio dodiruje dno i uronjen je u vodu. Vrlo je važno da **sami razmaz stolice bude iznad razine vode** (oko 1-2 cm) kako se stolica ne bi odmah isprala i zamutila tekućinu

4. **Kapilarni učinak**: Filter papir upija vodu prema gore. Na taj način razmaz stolice stalno ostaje vlažan, što stvara idealne uvjete za preživljavanje i razvoj parazita

5. **Inkubacija**: Epruveta se zatvara (uz minimalan dotok zraka) i ostavlja na sobnoj temperaturi (oko 25–28 °C) kroz **7 do 10 dana**

6. **Migracija ličinki**: Budući da ličinke *Strongyloides stercoralis* u stolici traže vodu i vlagu, one **migriraju s filter papira prema dolje u vodu** na dnu epruvete

7. **Pregled pod mikroskopom**: Nakon završetka inkubacije, pipetom se uzima sediment (tekućina s dna epruvete) i promatra se pod mikroskopom. Ako je infekcija prisutna, u čistoj vodi jasno se vide **žive, pokretne ličinke**

Pretrage na Enterobius

- Perianalni otisak ljepljivom trakom
- Prije kupanja, najbolje rano ujutro
- Preporuča se minimum 3, optimum 6 otisaka
- Analni bris

Parazitološke pretrage urogenitalnih uzoraka

- Trichomonas vaginalis
- Schistosoma haematobium
- Mikrosporidije
- Mikrofilarije

Parazitološke pretrage urogenitalnih uzoraka

Trichomonas vaginalis

- Uzorak: vaginalni, cervikalni sekret, uretralni iscjedak, sekret prostate, ejakulat, urin (prvi mlaz prvog jutarnjeg urina)
- Nativni preparat
- Pregledati preparat što prije
- Problem: leukociti
- Detekcija antigena – IC test
- Kultivacija – Diamonds, In Pouch (3-7 dana)
- PCR

Schistosoma haematobium

- Uzorak terminalni urin- tijekom mokrenja, kontrakcije mjehura istiskuju jajašca koja su se nakupila u sluznici i stijenci. Zato se najveća koncentracija jajašaca izbacuje u samom završetku mikcije

Parazitološke pretrage krvi

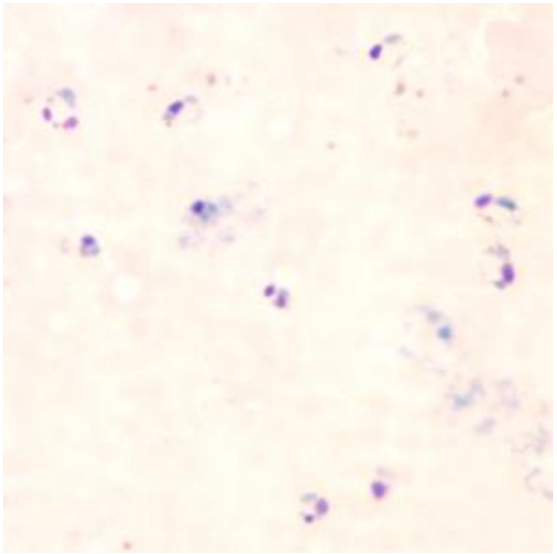
Direktna dijagnostika

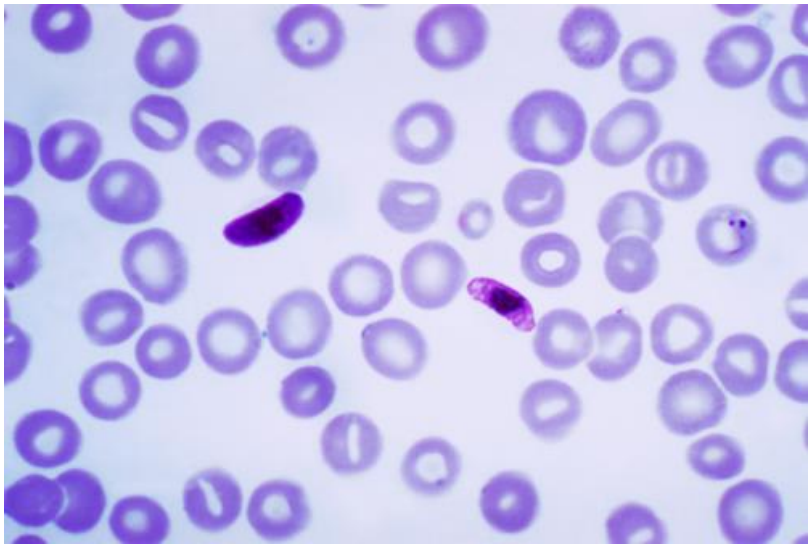
- Plasmodium
- Babesia
- Trypanosoma
- Leishmania
- Mikrofilarije
- Svježa krv bez antikoagulansa
- Krv sa antikoagulanosm (EDTA)
- Preferirana metoda bojenja Giemsa – nedostatak bojenje ovojnica kod mikrofilarija
- Oprez kod rada s potencijalno visoko infektivnim uzorkom!!!

Parazitološke pretrage krvi

Krvni razmaz i gusta kap

- Gusta kap – veća količina krvi, veća osjetljivost
- Krvni razmaz – konačna determinacija krvnog parazita
- Malarija- sumnja – ako je prvi set negativan – uzimanje uzoraka svakih 6-8 sati
- Preparati – idealno priprema unutar 1 sata od uzimanja krvi





Uzorak

- Uzimanje kapilarne krvi iz jagodice prsta, uške, pete – trenutna izrada guste kapi ili razmaza, antigenski test
- Uzimanje venske krvi u epruvetu s EDTA
  (preparati, serologija, molekularna)
- Heparin – može uzrokovati promjenu morfologije parazita
- Hitni transport u laboratorij –priprema razmaza i guste kapi unutar 1 sat od uzimanja- razvoj seksualnih oblika parazita, gubitak granulacija

Uzorak

- Jedan set –krvni razmaz + gusta kap – dovoljan u većini slučajeva
- Preporuka međunarodnih tijela za dijagnostiku malarije – optimalno 2 razmaza i 2 guste kapi
- Kada uzimati?

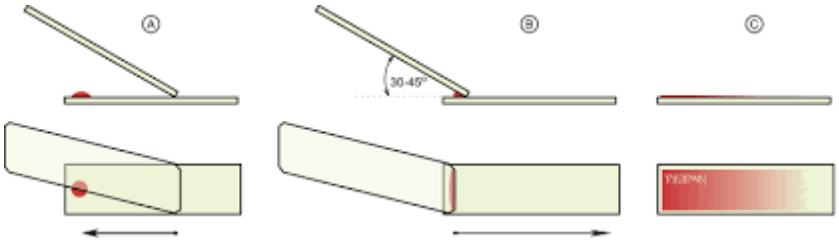
Clinical and laboratory standards institute -Svakih 6-8 sati unutar 3 dana dok se ne isključi malarija

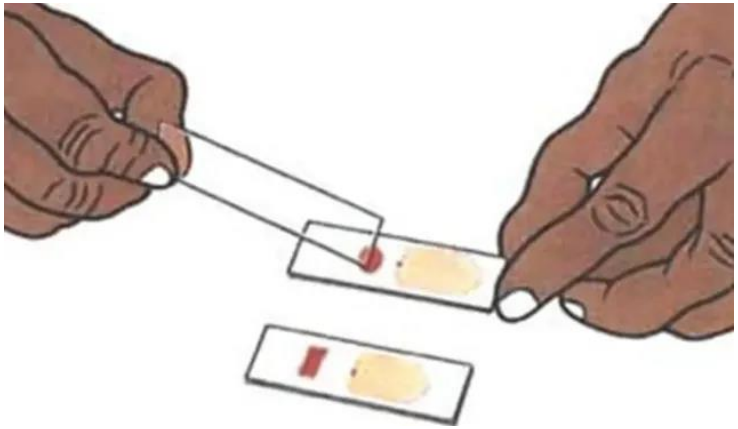
CDC – svakih 12 do 24 sata unutar 3 dana

Krv se može držati u hladnjaku duže vrijeme za molekularnu dijagnostiku

Krvni razmaz i gusta kap

Izrada





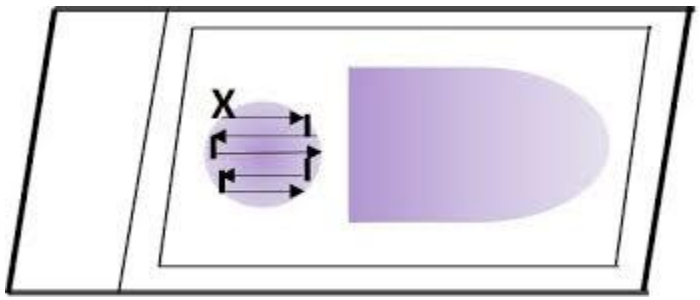
- Količine krvi

Krvni razmaz 1- 3 mikrolitra

Gusta kap 3-5 mikrolitra

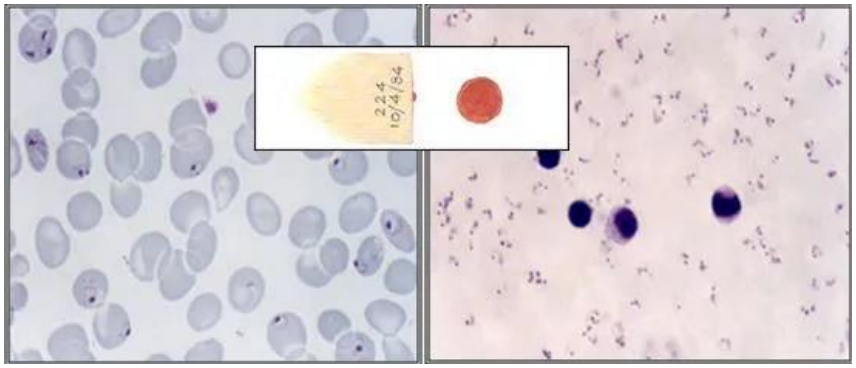
- Pipeta
- Kap iz prsta 50 mikrolitra

Izrada



- Krvni razmaz fiksacija alkoholom- 1 minuta
- Gusta kap – NE fiksira se
- Gusta kap 10-20 puta osjetljivija od krvnog razmaza -10-50 parazita po mikrolitru krvi (0.0002-0,001 % parazitemija)
- Gusta kap -primarna skreening metoda

Izrada

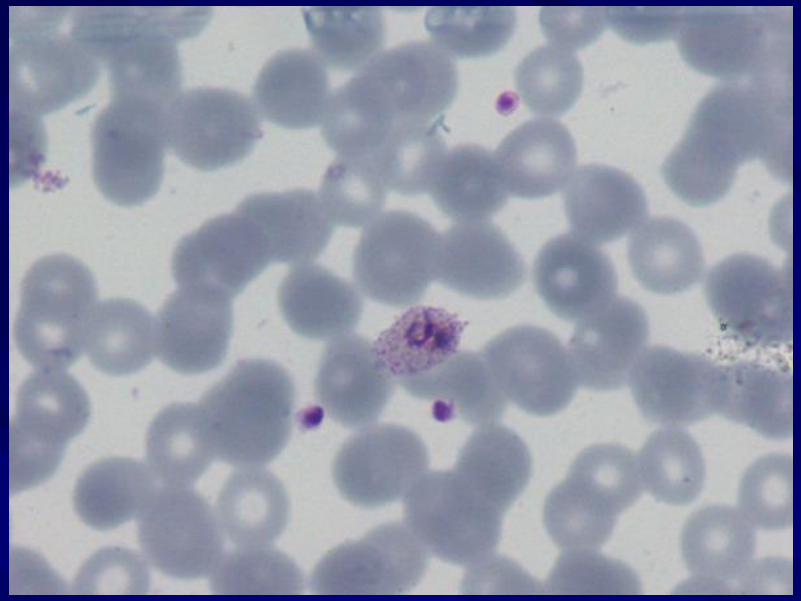


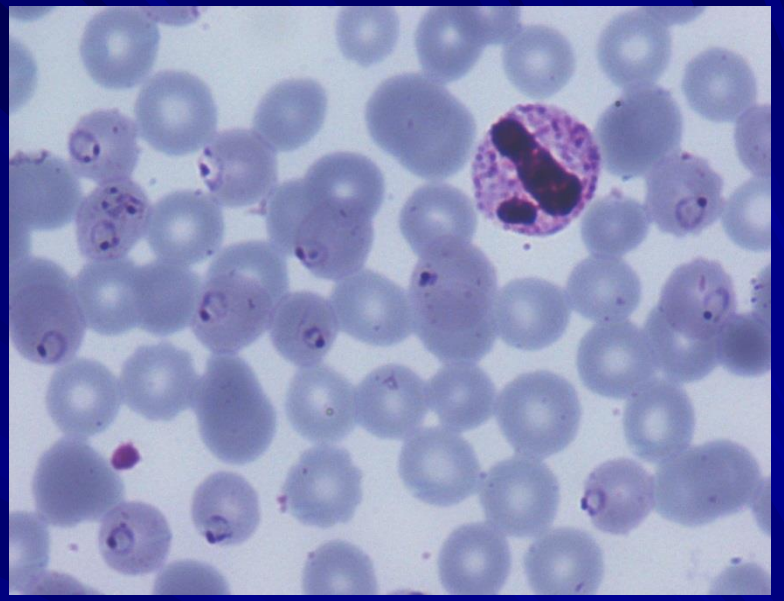
- Najčešća greška korištenje previše krvi
- 1,5- cm promjer – gustoća da se kroz gustu kap mogu čitati novine
- Sušenje- stavljanje u digestor s protokom zraka
- Bojenje preparata– s otopinom Giemsa pH 7,2-7,4

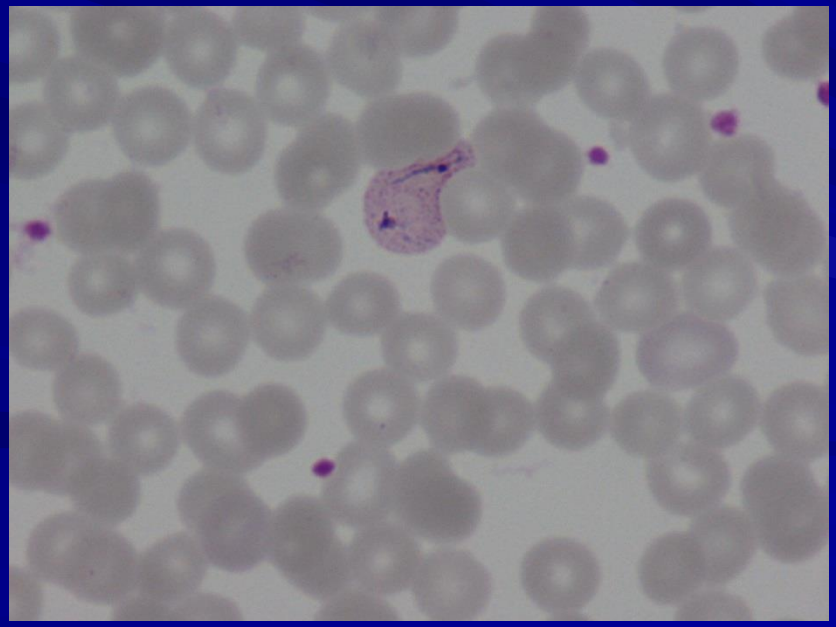
Na2HPO4	1gr
KH2PO4	0.7 gr
Destilirana voda	1000 ml

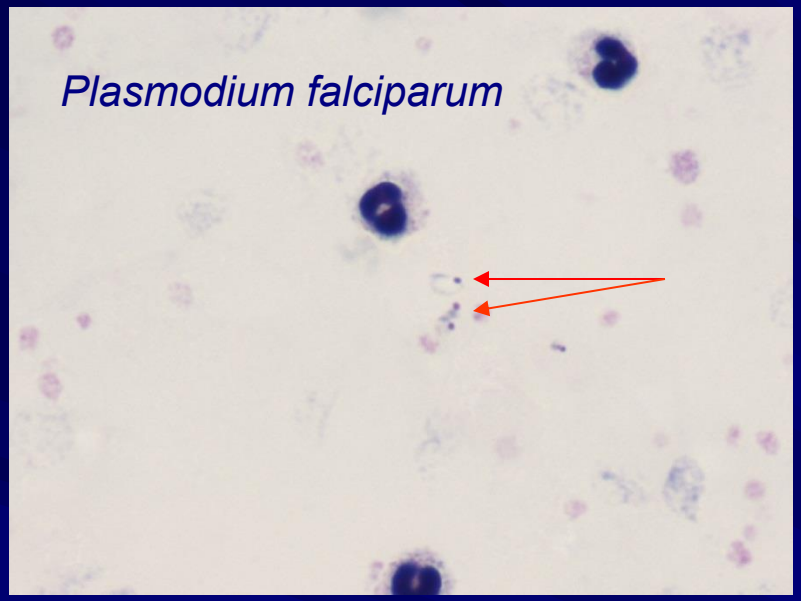
Razrjeđenje 1:10/20 – 1-2 kapi Giemse na 1 ml vode

Trajanje 20 do 45 minuta

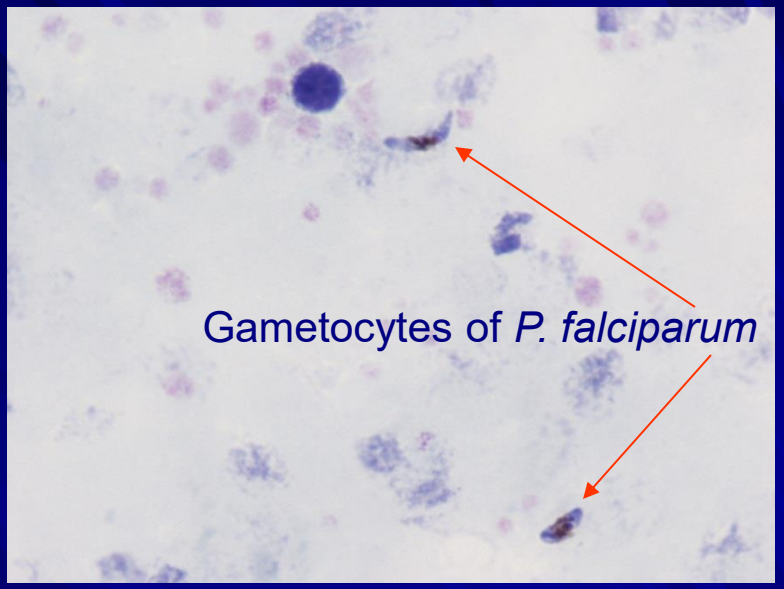




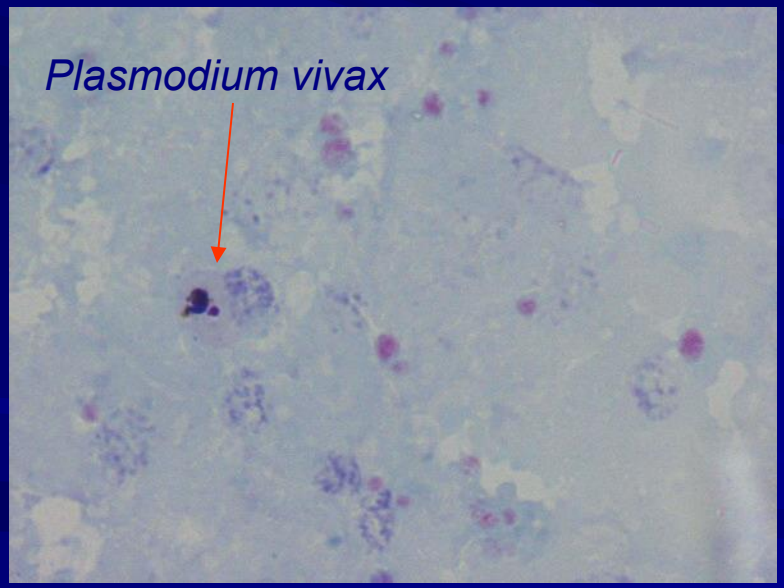




Plasmodium falciparum



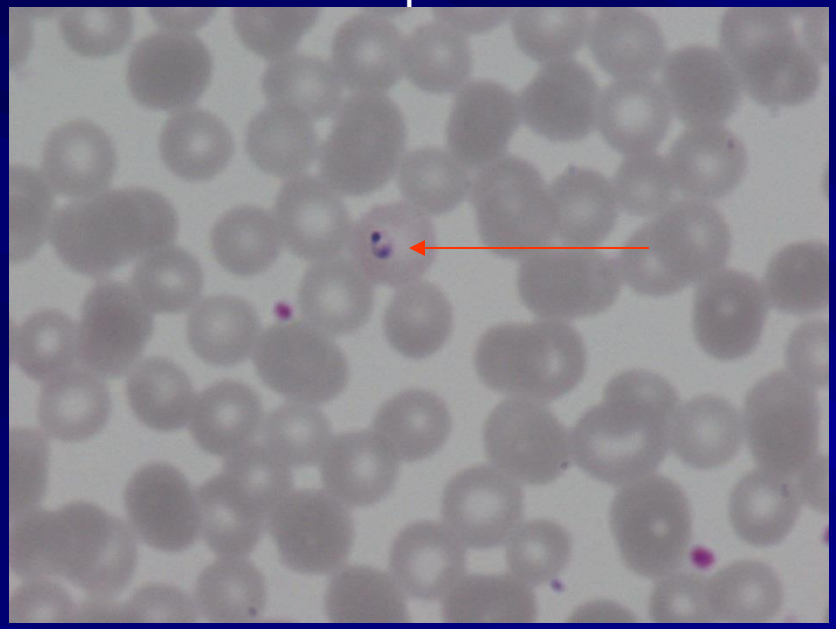
Gametocytes of P. falciparum



Plasmodium vivax

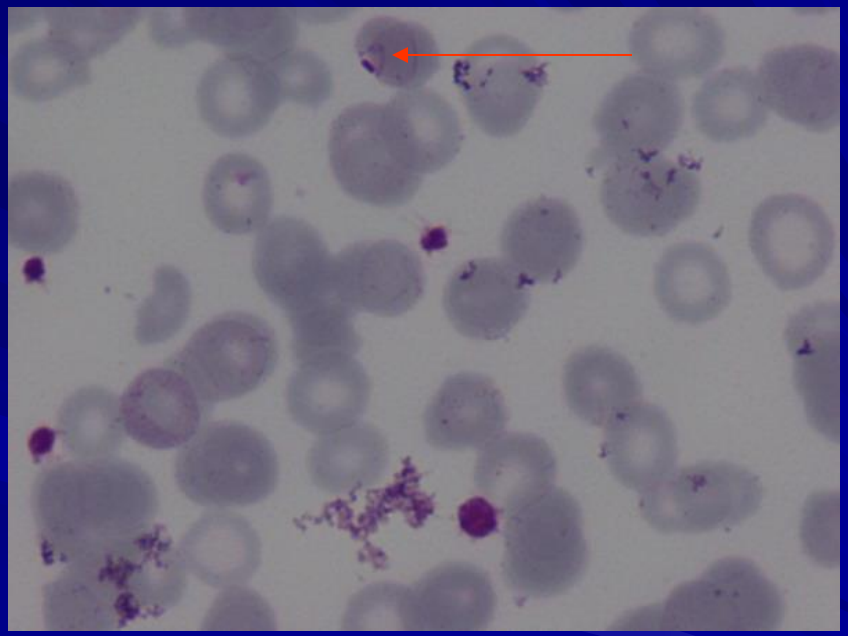
Babesia sp.

Incorrect pH

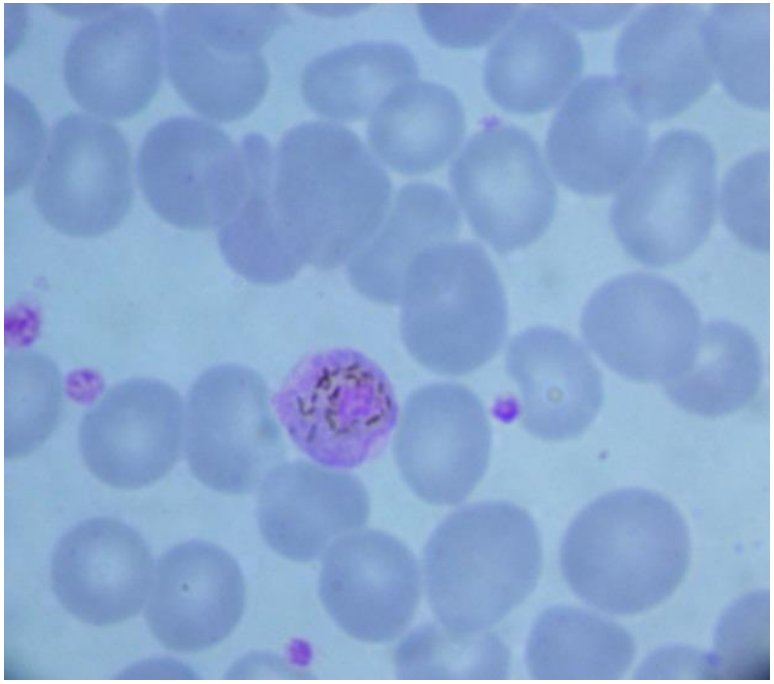


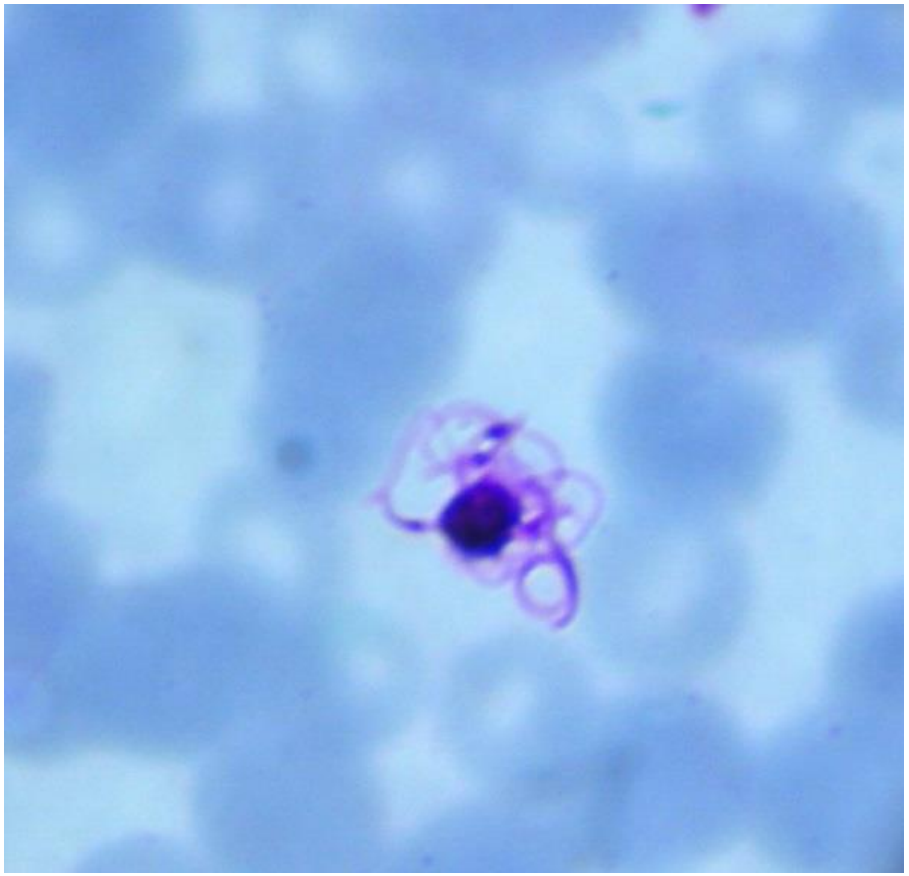
Plasmodium vivax –
no dots

Incorrect time (over staining)



Plasmodium falciparum
with stain deposit





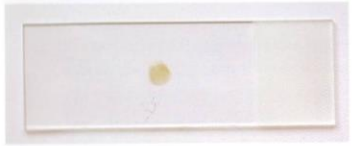


Fig. 1: Too little blood.
Troppo poco sangue.

Fig. 2: Too much blood.
Eccessiva quantità di sangue.

Fig. 3: The correct thickness of the thick film can be judged by the legibility of the printed text seen through the slide.
Corretta quantità di sangue, è possibile leggere attraverso la goccia i comuni caratteri di stampa.

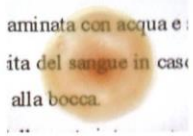

Fig. 4: Enlargement of the previous figure.
Ingrandimento della figura precedente.

Fig. 5: Too little blood.
Troppo poco sangue.

Fig. 6: Too much blood, the end of the film is lost.
Troppo sangue, manca la zona corretta per la lettura dello striscio.

Fig. 7: Edge of the spreader ragged.
Striscio sottile. Vetrino utilizzato per lo striscio con bordi scheggiati.

Fig. 8: Discontinuous movement of the spreader.

Molekularna dijagnostika

- Sve više ulazi u rutinu
- Osjetljivost i specifičnost uglavnom visoka
- Tipizacija
- Skuplja
- Klasični i real time PCR
- Single ili multiplex
- In house metodologija – nužna standardizacija
- Sindromski testovi

Diagnostic Test	Advantages	Disadvantages
Microscopy	• Relatively low cost • Widely available	• Poor sensitivity • Time consuming • Skilled microscopist essential
Immunoassay based methods	• Good sensitivty • Wide variety of kits available • Convenient adjunct to microscopic analysis	• Not widely available in developing countries due to cost constraints and limited detection spectrum of kits • False positives
Molecular/Nucleic acid amplification methods	• Exceptional sensitivity • Capable of species and subspecies	• Expensive reagents and instrumentation required • Requires skilled technician

Serološka dijagnostika

- Indirektna
- Brojne metode
- Epidemiološka potreba, dokaz akutne infekcije
- Problemi: križne reakcije, razlikovanje akutne od prošle infekcije, imunodeficijentni pacijent, novorođenče
- Western blot testovi

INVITED REVIEW

Artificial intelligence-powered microscopy: Transforming the landscape of parasitology

Mariana De Niz[1,2] | Sara Silva Pereira[3] | David Kirchenbuechler[1,2] | Leandro Lemgruber[4] | Constadina Arvanitis[1,2]

Key Advantages:

- **High Sensitivity and Accuracy:** often exceeds human performance in identifying parasites, especially in light-intensity infections
- **Reduced Lab Workload & Fatigue:** AI acts as an untiring screening tool, filtering out negative samples and reducing the manual burden on laboratory technicians.
- **Fast Diagnostics:** Automated systems can rapidly process large numbers of images**Standardization:** AI provides consistent, objective evaluations, reducing the variability associated with the skill level of human operators
- **Improved Access in Remote Settings:** Portable, smartphone-based, or low-power AI microscopy tools allow for diagnosis in resource-limited, remote areas

Key Disadvantages:

- **Data Dependence & Generalization:** AI models require large, diverse datasets for training; they may struggle with, or fail to recognize, species for which they have insufficient training data
- **High Initial Implementation Costs:** Setting up can be costly
- **Distinguishing Non-Pathogenic Organisms:** AI can sometimes mistake non-pathogenic protozoa or artifacts for parasites
- **Requirement for Expert Verification:** Despite high sensitivity, expert-verified AI often still out-performs fully autonomous AI, meaning human experts are still necessary, particularly for tricky cases or to avoid out-of-focus errors

DIAGNOSIS OF FECAL PARASITIC STAGES

Principle of diagnosis of Fecal parasitic stages

FECAL PROTOZOA:- Diagnostic Stages & Pictorial Key

- Challenges in the identification of fecal parasites

Diagnosis of Human Parasitic Infections (PI) = Diagnostic Parasitology

Diagnostic Approach

Diagnosis: (Latin)
Dia = through & Gnosis = knowledge

Reach THROUGH KNOWLEDGE
"YOU SHOULD HAVE THE KNOWLEDGE TO REACH"

Without diagnostics, medicine is blind

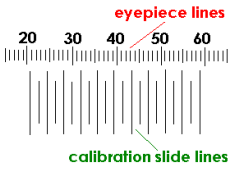
We (para/lab/microbiologists) are the eyes that can see,

But NOT SEEN

Diagnosis of parasitic infections in humans
is - Challenging,
- Interesting, and
- Fun.

includes

What is(are) the diagnostic approach for diagnosing PI?



Principles for Successful Microscopic Identification

I. Measurement	**Size** (microscope calibration by ocular and stage micrometry)	Diagnostic key-points
II. Movement	**Protozoa trophozoites** (fresh, unpreserved specimens)	
III.	**Shape,** **Special features,** **Color,** **Contents** (Internal structure(s) & Nuclear pattern)	
IV. Stains	**Internal structure(s) & Nuclear pattern**	

Morphology

Successful Microscopic Identification depends upon:

- **Collecting satisfactory specimens.**
- **Proper preparation and maintenance of reagents.**
- **Correct performance of techniques.**
- **Thorough examination of preparations.**

Size is one of the most important and a major diagnostic feature (A must)

Exact size of a microorganism ONLY determined by calibrated microscope (micrometer) – it is an essential tool in diagnostic parasitology

The Eyes Don't See
What the Mind Doesn't Know

A high Index of Suspicion
is the Key to identify rare parasite

Ayman El-Badry

Diagnosis of Human PIs

Diagnostic Approach

I. Clinical diagnosis "**Provisional diagnosis !**" **1. History** (Age, gender, residency, occupation, previous infection, family…)/Travel-moved
2. Complain (Symptoms)/**Clinical examinations** (signs)

II. Investigations "**Confirm diagnosis = Evidence**"

1. **Imaging** (**Diagnostic imaging**)

2. **Laboratory investigations** (**Lab diagnosis**)

Conventional

i. **Visualize parasite** (Direct from specimen or after ± Culture/animal inoculation)
Microscopy = Etiological/Morphological diagnosis

ii. **Detect parasite-Ag** OR **Host-Ab/sT-lymphocytes** ± Eosinophilia (CBC = complete blood count)
Immuno-diagnosis

Mol.

iii. **Detect parasite-nucleic acid (NA)** NA Hybridization/NAAT
Molecular diagnosis

+ **Special tests** e.g. Biochemical tests + **/Proteomics**

Diagnostic parasitology (Lab): Detection of parasite stage(s)/product(s) in clinical specimens using laboratory procedures.

Case I

A 24-years-old man had diarrhea for six weeks. He had traveled to South Asia a few weeks prior.

Is it normal to have mucus in stool in healthy individuals?

At the microbiology lab the stool specimen was processed.

The figure shows stool smear under the microscope by **Direct Wet mount**

What is your diagnosis?

Based on which criteria?

At the microbiology lab the stool specimen was processed.

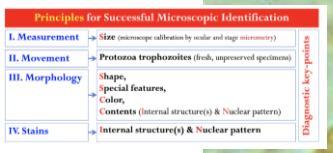
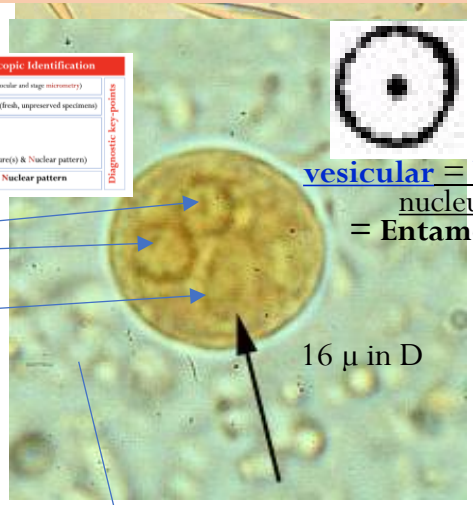
II. Movement
III. Morphology
IV. Stains

terin?

S Spherical
S 16 µ in diameter
C Brown (iodine)
C 2 nuclei **(vesicular)** [= small Nucleolus](Small + Central)
+Peripheral chromatin (Fine + evenly distributed)
-Diffuse glycogen vacuole (?)





vesicular = bull's eye nucleus
= **Entamoeba**

Dx Tip

focusing up and down on the focal plane of a cyst (also an egg surface)

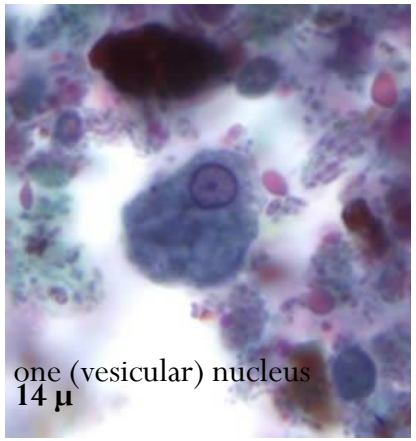
Principles for Successful Microscopic Identification

16 µ in D

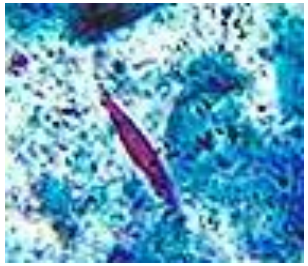
What is the next standard microscopic procedure?

When examining the **permanently stained faecal smear**, the following **images** are seen under the microscope

What is your diagnosis?
Based on which criteria?

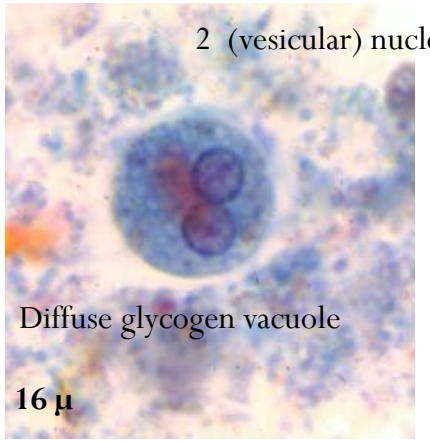


Entamoeba trophozoite



Charcot-Leyden crystal

Why do we have both trophozoite & cysts

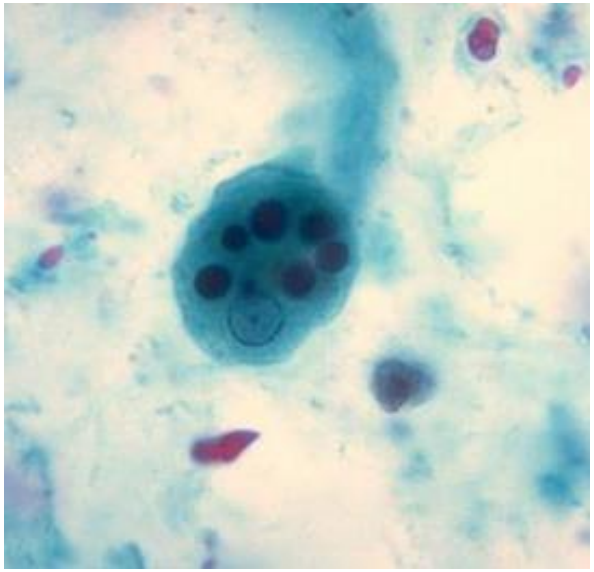


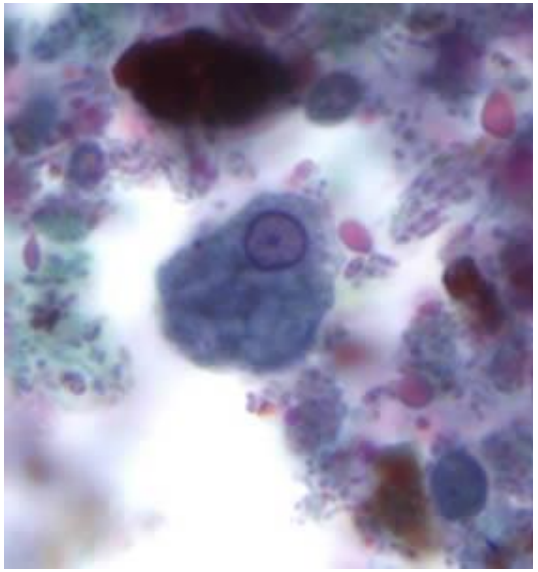
Entamoeba **Cyst**

What is the value of Trichrome (permanent) staining?

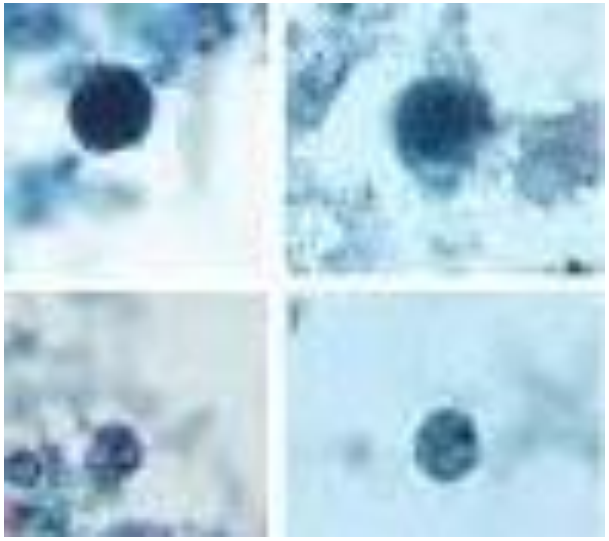
reported: "***Entamoeba histolytica* trophozoites and cysts."**

Identify the following 2 organisms?





What is the difference?



Temporarily *Buffered methylene blue* (*BMB*) stained wet mount Stains only amoeba Trophozoite:

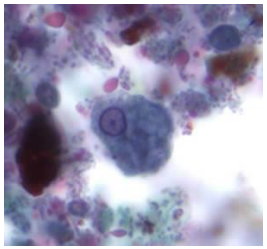
- **Cytoplasm** stains **light blue**
- **Nucleus & Inclusions** (e.g. **ingested RBCs** or **yeast cells**) stain **Dark Blue**

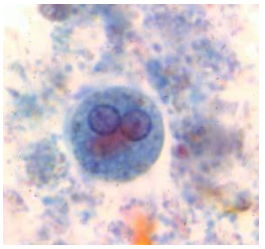
Does not stain amoeba cysts or flagellate trophozoites or cysts.

How many *Entamoebae* can inhabit human intestine?

Entamoeba contains many species,
Six of which reside in the lumen of human large intestine

- *E. histolytica*
- *E.dispar* (twin)
- *E. moshkovskii* (twin) (*Entamoeba bangladeshi*)
- *E.hartmanni* (little brother)
- *E.coli* (big sister)
- *E.polecki*





E.histolytica complex (*E.histolytica/E.dispar*) ?

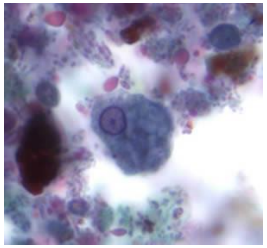
E.histolytica complex has THREE indistinguishable forms; two nonpathogenic forms, *E. dispar* & *E. moshkovskii* and pathogenic form, *E.histolytica* which are morphologically indistinguishable from pathogenic *E. histolytica* species.

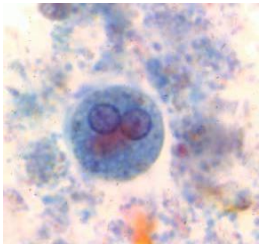
E. dispar & *E. moshkovskii* are responsible for approximately 10 times as many infections as *E. histolytica* & do not require treatment.

How many *Entamoebae* can inhabit human intestine?

***Entamoeba* contains many species,**
Six of which reside in the lumen of human large intestine

- ***E. histolytica***
- ***E.dispar* (twin)**
- ***E. moshkovskii* (twin)** (*Entamoeba bangladeshi*)
- ***E.hartmanni* (little brother)**
- ***E.coli* (big sister)**
- ***E.polecki***





Why the identified organism is not *E.hartmanni*?

E.H complex: trophozoites >12μm & the cysts >10μm.
Organisms that measure below these measurements should be identified as *E. hartmanni* [5–10 μm (usual range, 6–8 μm)].

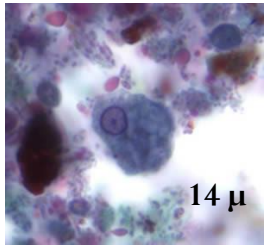
Practice tip.

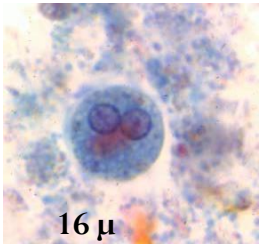
Cysts tend to **shrink** - "**halo**"

How many *Entamoebae* can inhabit human intestine?

***Entamoeba* contains many species,**
Six of which reside in the lumen of human large intestine

- ***E. histolytica***
- ***E.dispar* (twin)**
- ***E. moshkovskii* (twin)** *(Entamoeba bangladeshi)*
- ***E.hartmanni* (little brother)**
- ***E.coli* (big sister)**
- ***E.polecki***





Why the identified organism is not *E.coli*?

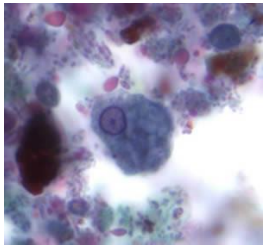
In vesicular nucleus: chromatin irregularly stained; karyosome eccentric

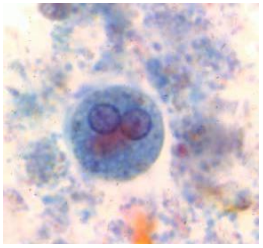
Trophozoites are often mistaken for E.**histolytica** due to their overlap in size [10–35 µm (usual range, 15–25 µm)].
The cysts are distinguished by noticing the 5-8 nuclei found **in the** mature form.

How many *Entamoebae* can inhabit human intestine?

***Entamoeba* contains many species,**
Six of which reside in the human intestinal lumen

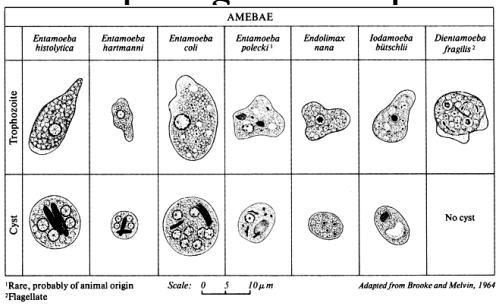
- ***E. histolytica***
- ***E.dispar***
- ***E. moshkovskii*** *(Entamoeba bangladeshi)*
- ***E.hartmanni***
- ***E.coli***
- ***E.polecki***





Others amoebae & intestinal protozoa in addition to pseudoparasites (artifacts) are morphologically different but sometimes there is morphological overlap with *E.histolytica*

- ***Endolimax nana***
- ***Iodamoeba butschili***
- ***Blastocystis spp.***
- ***Dientamoeba fragilis***



***E.histolytica* is Over-Diagnosed & Over-treated**

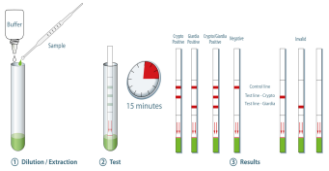
What are other diagnostic option for giardiasis?

Detect – ***Entamoeba histolytica complex*** **antigen** (**IAs**), **or**
- *Entamoeba histolytica* DNA (**PCR**)

Entamoeba Faecal Immunoassays (Faecal IAs)

-Enzyme/florescent immunoassay (Screening).
- Rapid immunochromatographic (ICT) assay [cartilage/casset]
Detects **Entamoeba antigen**.
Also available to detect antigens of ***Giardia*** & ***Cryptosporidium*** **OR**
Entamoeba, ***Giardia*** & ***Cryptosporidium***.

Quick & **easy** to perform and **no special** equipment is needed.
- Borderline positives & Questionable negative results, require further confirmed by additional testing.



Entameoba Faecal DNA (Faecal PCR)

Confirm diagnosis & differentiate *Entamoeba histolytica* complex species

E.histolytica, What is the problem

PCR assays, a practical non-microscopic method, can **differentiate** between **amoebae infections.**

So PCR assays → Determine the true prevalence of ***E. histolytica*** → avoid unnecessary treatment (Overmedication).

Over-Diagnosis + Over-Medication

A Need for Molecular Diagnosis

CASE II

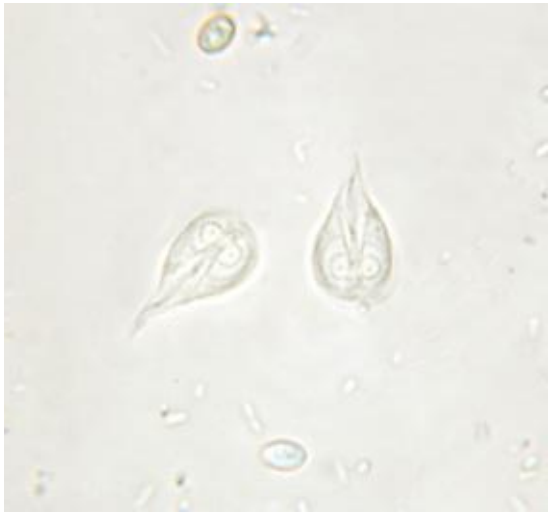
A 7-year-old girl was brought by her mother to GIT clinic. She had diarrhea for 4 days.

Her symptoms included epigastric pain, abdominal cramps, **watery foul-smelling fatty stool, and excess gas**.

At the microbiology lab the stool specimen was processed direct wet mount.

Figure show what was detected in stool smear under the microscope (**unstained faecal smear)**

What is your diagnosis?
Based on which criteria?



http://www.atlas-protozoa.com/gallery.php?SOT_CAP=ARTE#0

At the microbiology lab the stool specimen was processed direct wet mount.

Figure show what was detected in stool smear under the microscope (**unstained faecal smear)**

What is your diagnosis?
Based on which criteria?

S **pyriform**
S **5-10x10-20 (7-14) um**
C **- 2 nuclei**
C **-2 sucking discs**
- Flagella
Axostyle, &
comma-shaped **parabasal bodies (**Not seen in unstained trophozite)

2. Serology (Antibodies detection)

Mention the role of serology in diagnosing urogenital parasites.

Protozoi krvi i tkiva

Medicinsko značajni krvno - tkivni protozoi

- Plasmodium
- Babesia
- Toxoplasma
- Acanthamoeba
- Balamuthia
- Naegleria
- Leishmania
- Trypanosoma

Medicinsko značajni krvno - tkivni protozoi

Protisti tjelesnih šupljina

- Filogenetski stariji
- Bolje prilagođeni
- Rijetko izazivaju ozbiljne smetnje

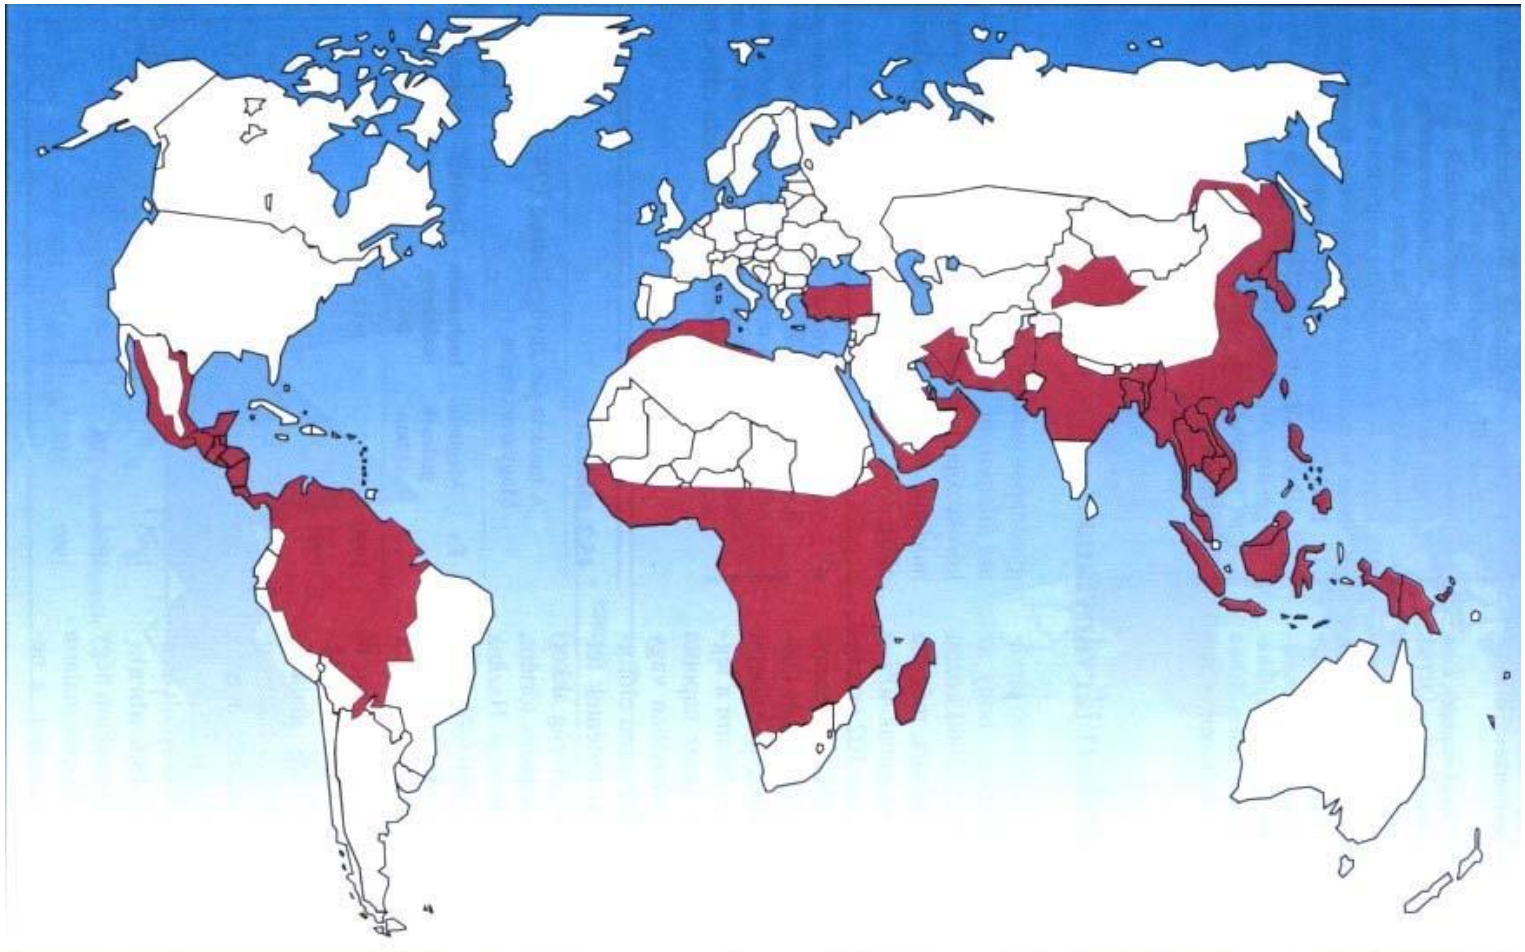
Krvno-tkivni protisti

- Većina se prenosi hematofagnim člankonošcima
- Bolesti dramatične, mogu imati smrtni ishod

Malarija – Plasmodium

- Uzročnik malarije
- Jedna od najznačajnijih infektivnih bolesti današnjice
- WHO (2009) - endemska u 100 zemalja svijeta (40% ljudi, 2,5 milijarde ljudi izloženo)
- Godišnja incidencija- 300-400 mil.kliničkih slučajeva
- Godišnji mortalitet oko 0,5 mil.ljudi

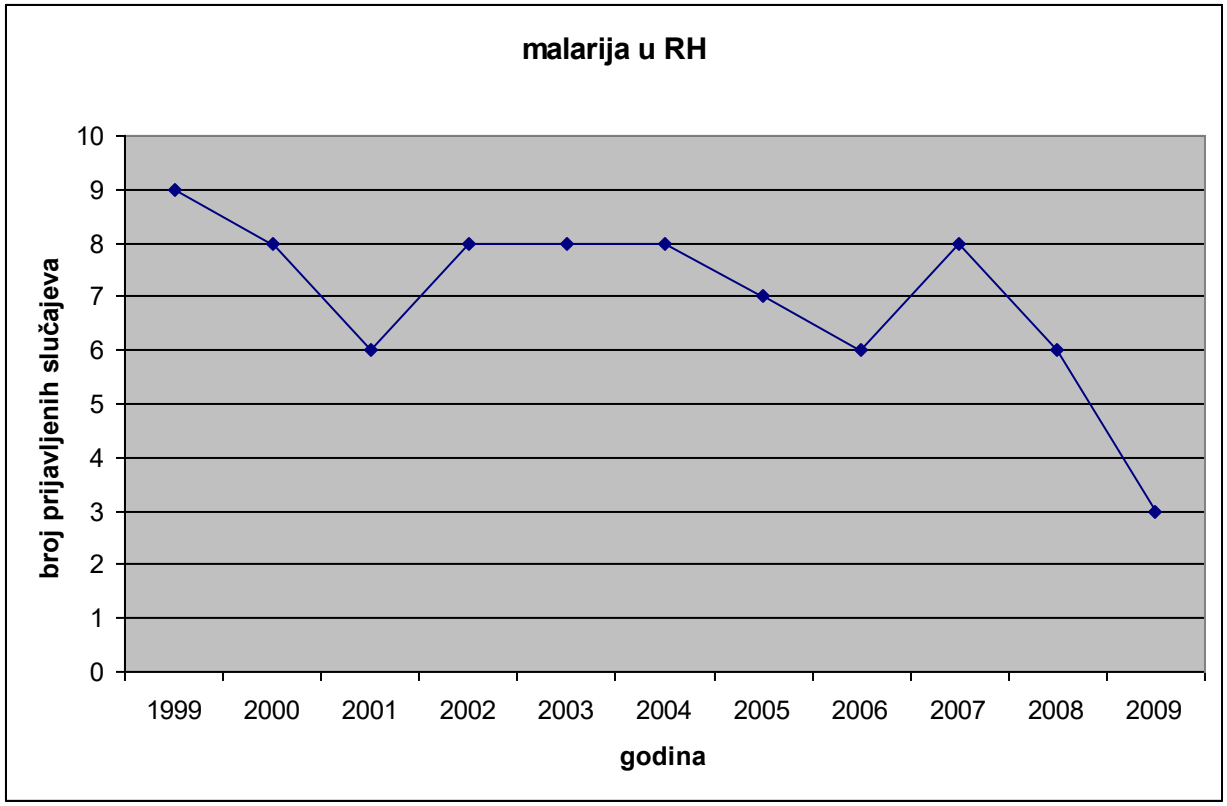
Malarija – Plasmodium



Malarija – Plasmodium

- Malarija putnika (turisti, radnici)
- Malarija zračnih luka
- Transfuzijska malarija
- Malarija u i.v. korisnika droga

Malarija – Plasmodium



Malarija – Plasmodium

- Poznato oko 172 vrste
- Za čovjeka specifični

Plasmodium vivax

Plasmodium ovale

Plasmodium malariae

Plasmodium falciparum

Plasmodium knowlesi

Malarija – Plasmodium

- Inkubacija 7-35 dana
- Klinička slika - ovisna o vrsti plazmodija, imunom statusu bolesnika, dobi
- Simptomi: nespecifični inicijalni simptomi - glavobolja, bolovi u mišićima, opća slabost, mučnina, tresavica, visoka temperatura (kontinua, intermitentna), znojenje, proljev
- Anemija, cerebralna malarija, konvulzije, respiratorni distres, cirkulatorni kolaps, zatajenje bubrega

Malaria tertiana

- P.vivax i P.ovale
- Inkubacija: 9-20 dana (rjeđe nekoliko tjedana do mjeseci)
- Parazitemija: niska (max. 1-2 %)
- Tijek: obično benigan
- Česti relapsi (do 5 godina)- hipnozoiti

Malaria quartana

- P.malariae
- Inkubacija: 15-40 dana
- Parazitemija: niska (max. 1%)
- Tijek: obično benigan
- Česte rekrudescence (do 30 godina)

Malaria tropica

- P.falciparum
- Inkubacija: 7-15 dana ili duže
- Parazitemija: visoka (20% i više)
- Tijek:
  - inicijalni simptomi jače naglašeni
  - težak tijek u neimunih osoba
  - visok letalitet u neliječenih
    (50-60% u neimunih Europljana)

Malaria tropica

- Rekrudescenca rijetka, obično unutar godine dana
- Moguće teške komplikacije:

cerebralna malarija, teška anemija, edem pluća i respiratorna insuficijencija, bubrežna insuficijencija, cirkulatorni kolaps, hemoragije, DIK, hiperpireksija

Malaria quotidiana – P. knowlesi

- Uzročnik malarije u dugorepih majmuna makaka (*Macaca fascicularis*)
- Prije par godina prihvaćen kao “novi” uzročnik malarije u čovjeka

  (broj slučajeva, prijenos čovjek-komarac-čovjek)

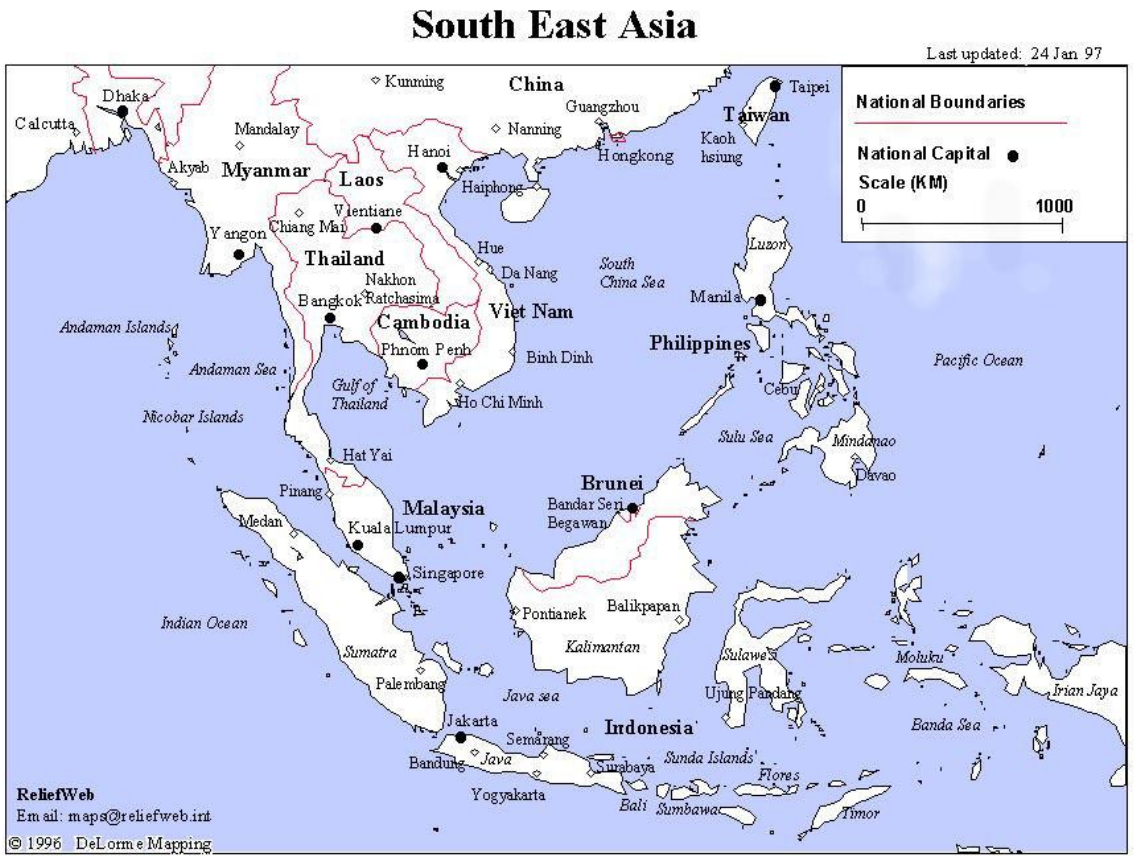
Malaria quotidiana – P. knowlesi

- 1931. godina-Knowles-opis-majmun Macaca
- 1932. godina – eksperimentalno dokazano da može uzrokovati klinički manifestnu bolest kod ljudi
- Do 1955. godine – korišten kao piretički agens za liječenje sifilisa kod pacijenata s neurosifilisom

Malaria quotidiana – P. knowlesi

- 1965 – prvi slučaj prirodno stečene *P. knowlesi* malarije Malezija
- 1971– drugi opisan slučaj prirodno stečene bolesti (Malezija)
- 2004 – povećani broj izvješća o ovoj infekciji u jugo istočnoj Aziji
- Molekularna djagnostika
- Spremljeni serumi, preparati (1990 – *P. knowlesi* prisutan)
- Do 70% slučajeva malarije u jugoistočnoj Aziji uzrokovano ovim parazitom (Singh et al. Lancet, 2004. 369: 1017-1024

Malaria quotidiana – P. knowlesi



The boundaries and names shown on this map do not imply official endorsement or acceptance by the United Nations or ReliefWeb. These maps may be freely distributed. If more current information is available, please update the maps and return them to ReliefWeb for posting.

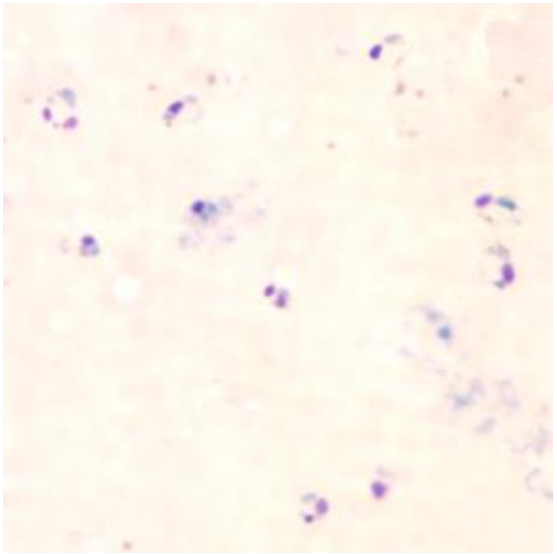
Malaria quotidiana – P. knowlesi

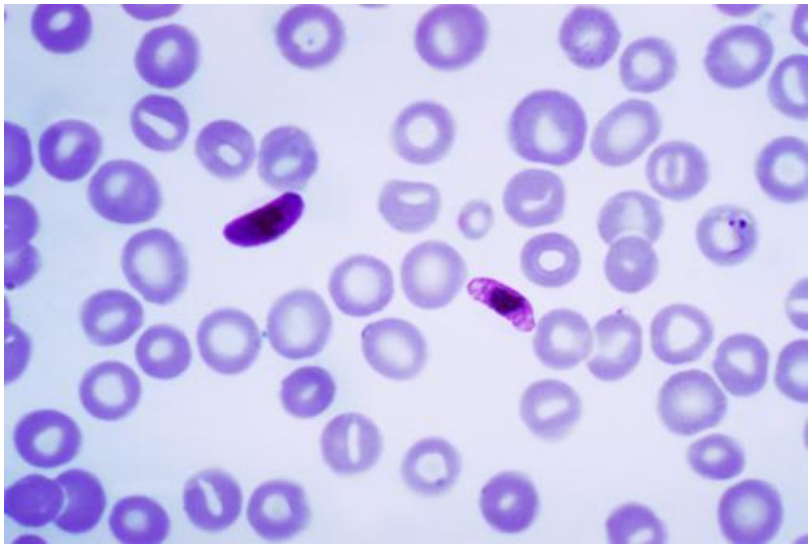
- Život u eritrocitu – 24 sata
- Visoka parazitemija, klinička slika
- Hipnozoiti nisu nađeni

Malarija - dijagnostika

Krvni razmaz i gusta kap

- Gusta kap – veća količina krvi, veća osjetljivost
- Krvni razmaz – konačna determinacija krvnog parazita





Malarija - dijagnostika

- Mikroskopija
- Veličina
- Oblik eritrocita
- Oblici - svi ili samo neki, nazubljeni eritrocit, plastičan, forme uz membranu, slušalice
- Granulacije
- Trfozoiti, ameboid
- Merozoiti – broj, forma
- Gametociti
- Parazitemija

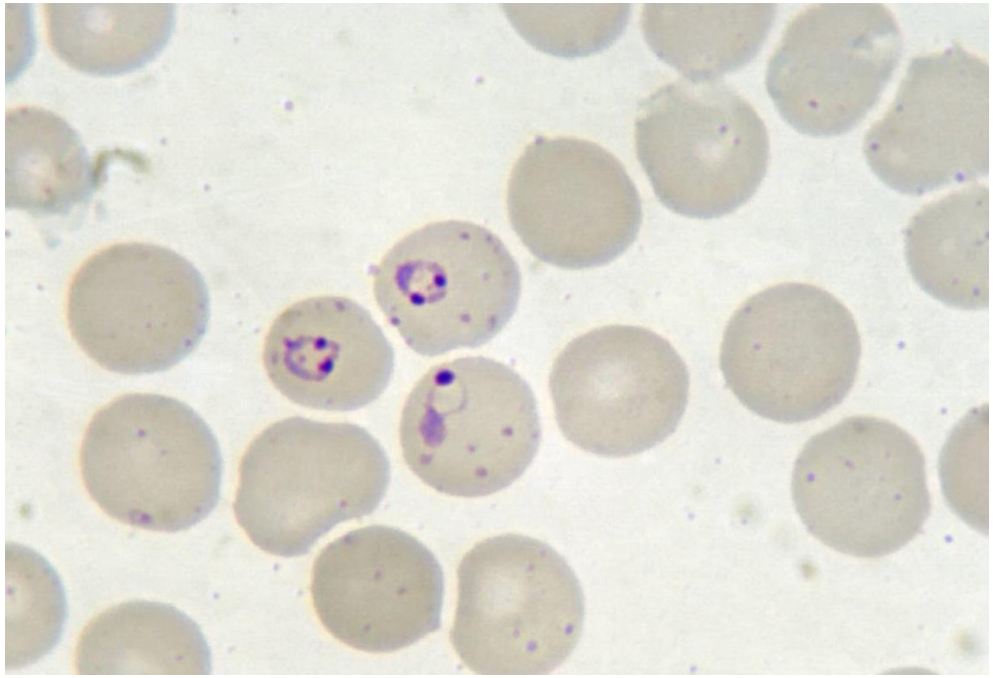
P. knowlesi

Krvni razmaz i gusta kap

Rani trofozoit

- Prsten ispunjava do 1/3 eritrocita
- Ponekad više prstenova u jednom eritrocitu
- Dvostruki kromatin

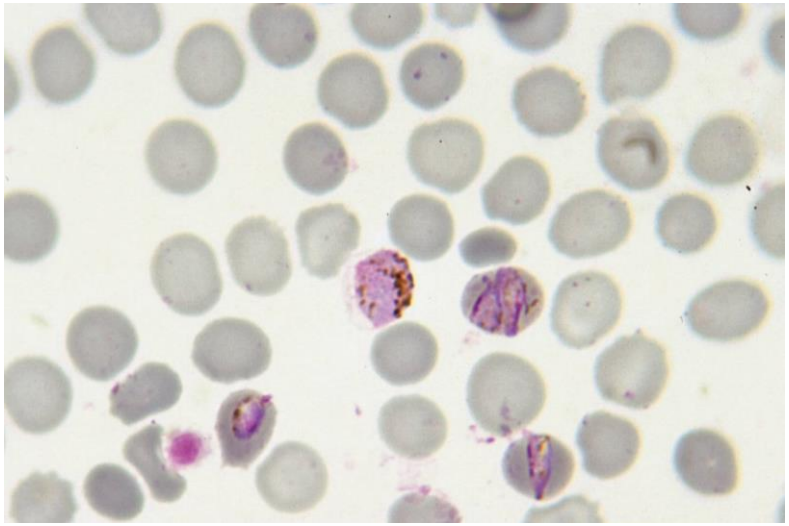


P. knowlesi

Krvni razmaz i gusta kap

Kasni trofozoit

- Zauzima ne više od 2/3 eritrocita
- Citoplazma kompaktna, ne ameboidna, “poput vrpce”



P. knowlesi

Krvni razmaz i gusta kap

Šizonti

- 8-16 merozoita
- Crni malarični pigment
- Rozeta česta

How Malaria Vaccines
Are Changing the Game
CONTINENTAL
HOSPITALS
Our Healing Touch..
VACCINE
Malaria

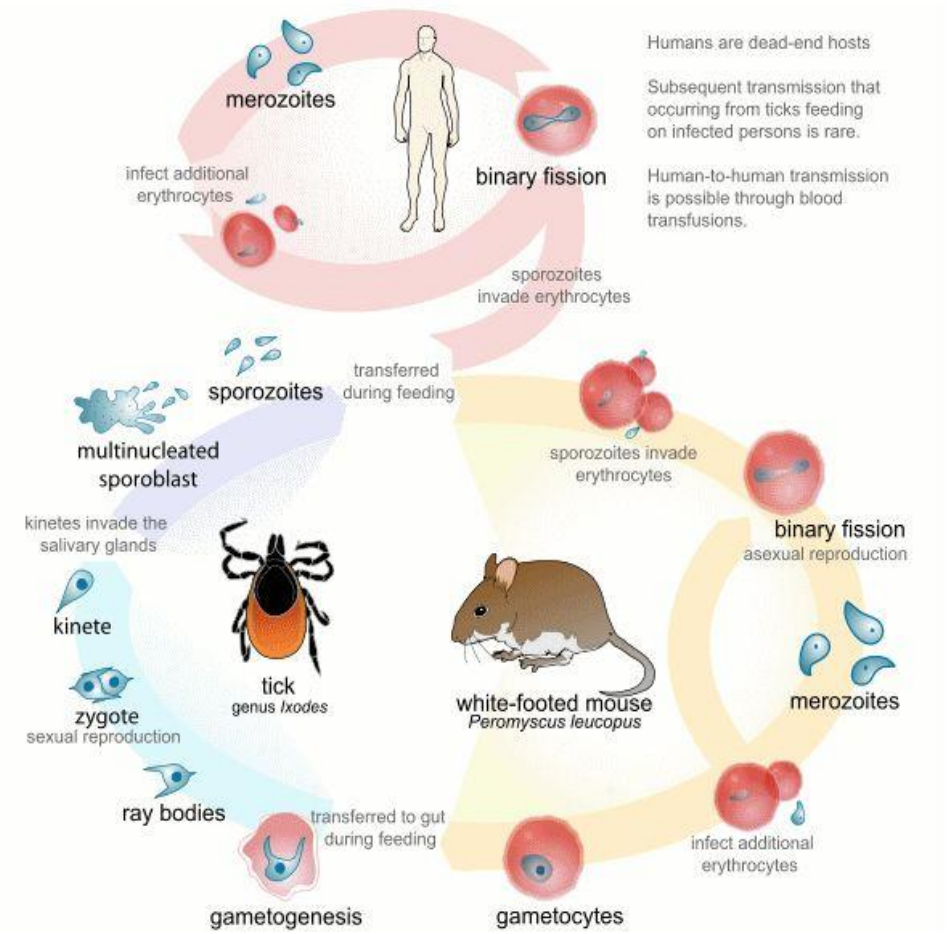
Babesia

- Inficira brojne divlje i domaće životinje
- Krpelji
- Mali (trofozoiti 1-2,5 μm)– B. microti i B. gibsoni
- Veliki (trofozoiti 2,5-5,0 μm) – B. bovis i B. canis

Babesia

Životni ciklus

- Nema egzoeritrocitnog oblika
- Unutar eritrocita dioba dvojnom diobom ne shizogonijom
- Gametociti postoje no morfološki se ne mogu razlikovati od trofozoita



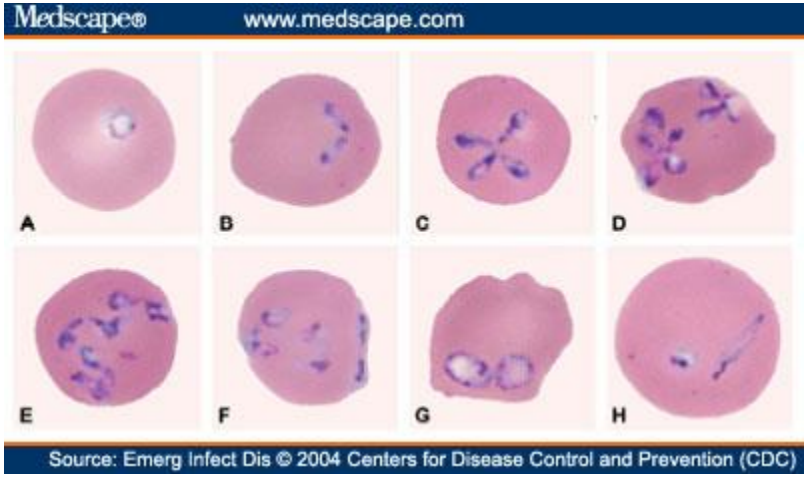
Babesia

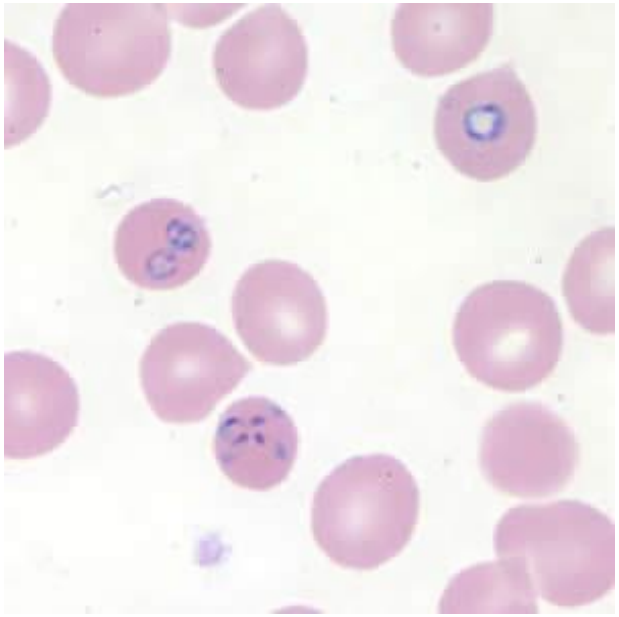
Klinička slika

- Asimptomatska – fulminantna bolest
- Predisponirajući čimbenici – imunosupresija, splenektomija, starija životna dob

Babesia

- Dijagnostika
- Krvni razmaz
- Mali trofozoiti
- Ekstracelularni trofozoiti
- Više trofozoita u jednom eritrocitu
- Vakuole u trofozoitima
- Tetrade
- Serologija
- PCR





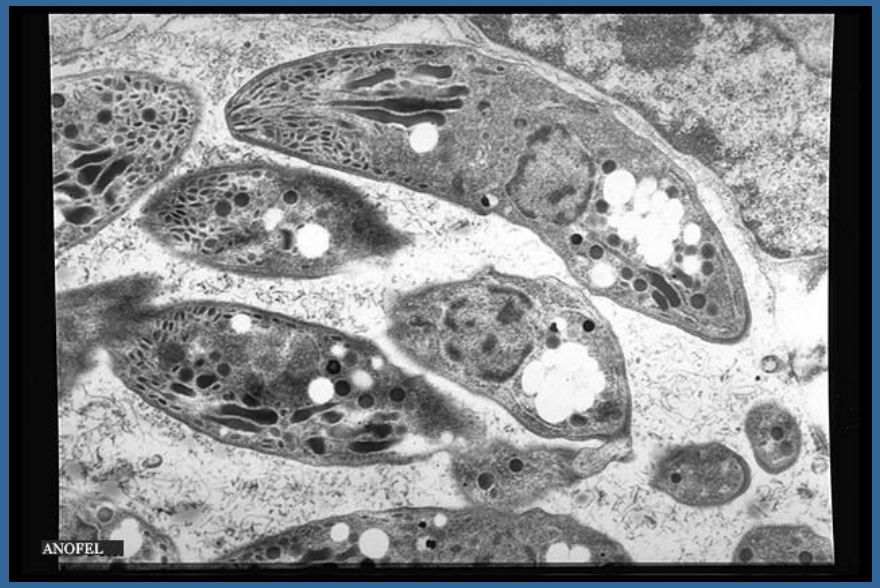
Medicinsko značajni krvno - tkivni protozoi

- Plasmodium
- Babesia
- Toxoplasma
- Acanthamoeba
- Balamuthia
- Naegleria
- Leishmania
- Trypanosoma

Toxoplasma gondii

Toxoplasma gondii

- Jednostanični parazit iz koljena kokcidija
- Tri morfološka oblika:
  Oocista
  Bradizoit
  Tahizoit
- Tri klonalna genotipa: I, II, III
  Za čovjeka najznačajniji genotip II



Povijest

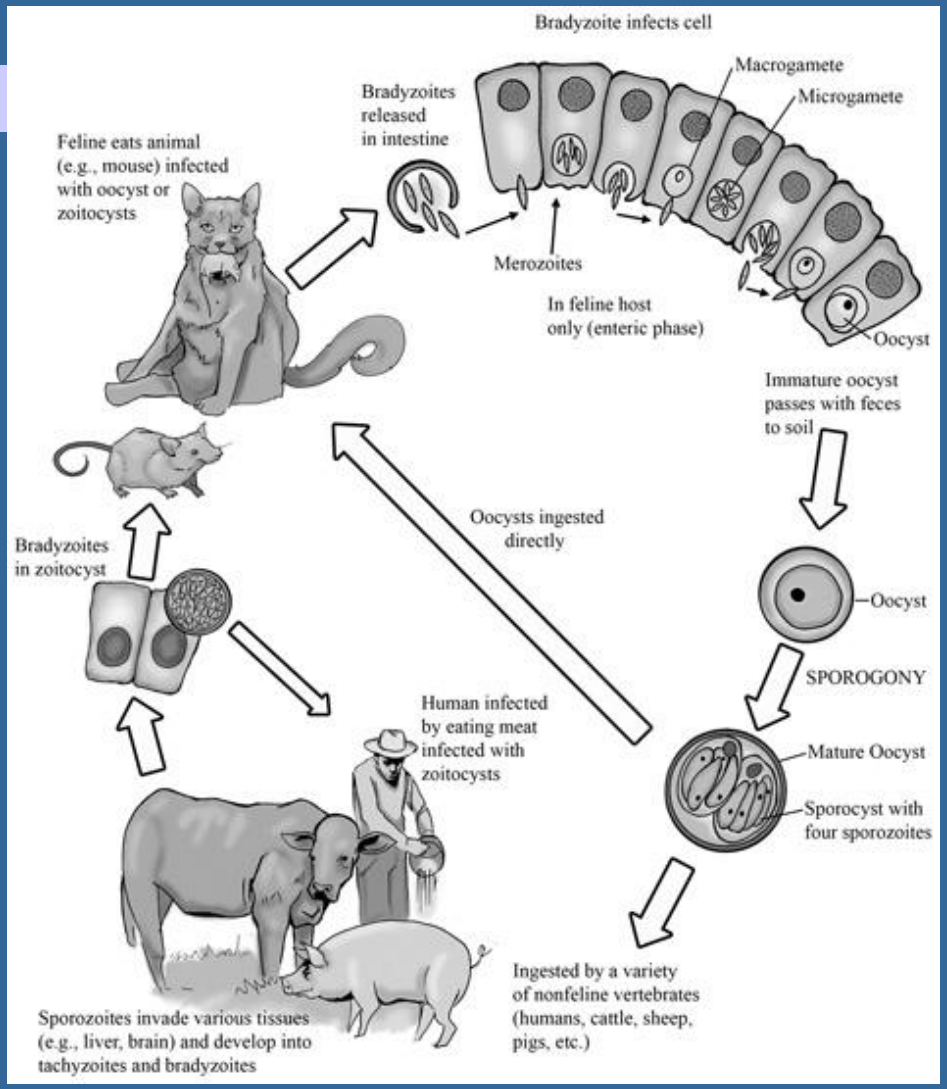
- 1908. Nicolle i Manceaux – *T. gondii* merozoit - afrički glodavac *Ctenodactylus gondii*
- 1923. Janku – toksoplazmoza u 11 mjesečnog dojenčeta s hidrocefalusom i mikroftalmijom
- 1937. Pinkerton – diseminirana toksoplazmoza sa smrtnim ishodom u 22 godišnjeg mladića
- 1942. Paige – opisan vertikalni prijenos bolesti
- 1948. Sabin i Feldman – Dye test
- 1970. Dubey – u potpunosti razjašnjen životni ciklus parazita
- 1981. opisan *T. gondii* encefalitis u AIDS pacijenta

Epidemiologija

- Antropozoonoza – bolest toplokrvnih životinja (ptice, sisavci) i čovjeka, biljojeda, svejeda, mesojeda

Putevi prijenosa

- Konzumacija termički nedovoljno obrađenog ili sirovog mesa, jaja, mlijeka (kuhinjski pribor – noževi, daska za rezanje)
- Ingestija oocista iz okoliša (geofagija, zagađena voda, hrana, muhe, žohari)
- Transplacentarni put prijenosa
- Transfuzija krvi, transplantacija organa
- Laboratorijski put prijenosa



Epidemiologija

Svijet

- 1/3 svjetske populacije inficirana
- Seroprevalenca - ovisi o geografskom području i prehrambenim navikama

Seroprevalenca u žena generativne dobi:

- Skandinavija 11-28%
- Središnja Europa 37-58%
- Afrika 54-77%

Epidemiologija

Hrvatska

- Seroprevalenca - žene s područja grada Zagreba (1) -51%
  -stanovnici grada Kutine (2) – 72,4%
- Serumi 1464 žitelja Splitsko-dalmatinske županije u dobi od 2-84 godine testirani su EIA metodom na prisustvo IgG protutijela na *T. gondii* (3)
  U 533 seruma (36,4%) nađena su protutijela na toksoplazmu
- Serumi 502 žene generativne dobi (16-45 godina) testirani su na prisustvo protutijela na *T. gondii* (4)
  U 146 (29,1%) žena nađena su protutijela na toksoplazmu

- 1.Derkos-Mikulić V. *Prevalence of antobodies to T. gondii in parurients and nonpregnant women in a larger area of the city of Zagreb*. Acta Parasitol Iugoslav 1974;5:67-72.
- 2.Konjević P. *Izloženost kongenitalnoj toksoplazmozi na području općine Kutina* (magistarski rad). Zagreb: Medicinski fakultet Sveučilišta u Zagrebu; 1978.
- 3. Tonkić M, Punda Polić V, Sardelić S, Čapkun V. *Učestalost protutijela za T. gondii u populaciji Splitsko-dalmatinske županije*. Liječnički vjesnik 2002;124:19-22.
- 4. Vilibić Čavlek T, Ljubin Sternak S, Ban M, Kolarić B, Sviben M, Mlinarić Galinović G. *Seroprevalence of TORCH infections in women of childbearing age in Croatia*. The Journal of Maternal-Fetal & Neonatal Medicine 2011;24:280-283.

Klinička slika

Toksoplazmoza u:

- Imunokompetentne osobe
- Imunodeficijentne osobe
- Okularna
- U trudnoći
- Kongenitalna

Klinička slika

Toksoplazmoza u imunokompetentne osobe

- U 10-20% pacijenata simptomatska bolest

Toksoplazmoza u imunodeficijentne osobe

- Mortalitet 100%

Očna toksoplazmoza

- Infekcija *T. gondii* jedan je od najčešćih uzroka uveitisa i najčešći uzrok retinitisa u imunokompetentne osobe
- Posljedice: potpuni ili parcijalni gubitak vida, glaukom

Klinička slika

Toksoplazmoza u trudnoći

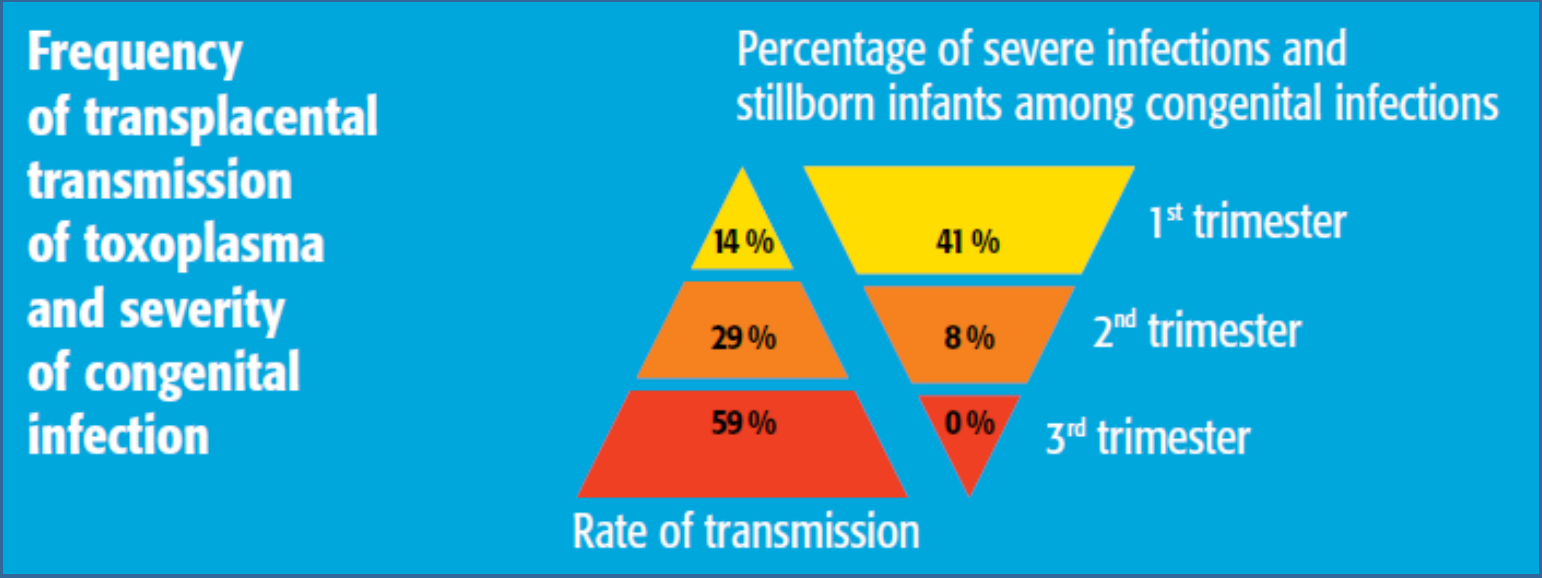
- Najčešće asimptomatska
- Moguć prijenos infekcije na plod (neovisan o prisutnosti simptomatske infekcije)
- Rizik gotovo u potpunosti ograničen na trudnice koje su infekciju stekle tijekom trajanja trudnoće
- Iznimke

  -infekcija novim agresivnijim sojem parazita kod kronično inficiranih trudnica

  -infekcija imunodeficijentne trudnice - reaktivacija parazita

Klinička slika

Toksoplazmoza u trudnoći



Slika preuzeta: www.biomerieux.com/toxoplasmosis

Klinička slika

Kongenitalna toksoplazmoza

Posljedice:

- Smrt, korioretinitis, strabizam, sljepoća, epilepsija, psihomotorna i mentalna retardacija, anemija, žutica, osip, petehije, encefalitis, pneumonitis, mikrocefalija, intrakranijske kalcifikacije, hidrocefalus
- Infekcija tijekom trudnoće – spontani pobačaj, mrtvorođenje, prijevremeni porod

Dijagnostika

Direktna

- Mikroskopija
- Detekcija antigena
- Metode detekcije nukleinske kiseline
- Kultivacija

Indirektna

- Serološka dijagnostika specifičnih protutijela

Dijagnostika

Uzorci

- Serum/krv
- Likvor
- Očna vodica
- Amnionska tekućina
- Bioptati organa

- Serum – spremanje do tjedan dana na +4˚C ili kod dužeg spremanja na -20˚C
- Transport seruma na temperaturi okoline (put‹1 tjedan; temperatura okoline‹30˚C)
- Ako je nužna usporedba dva seruma – istovremeno testiranje oba seruma
- Testiranje likvora/očne vodice + seruma – uzorci uzeti isti dan i testirani isti dan
- PCR – krv se uzima s antikoagulansom (transport +4˚C)

Dijagnostika

Direktna dijagnostika – mikroskopija

- Tjelesne tekućine (BAL, AT), bioptati tkiva i organa, heparinizirana krv, likvor
- Tekući uzorci → centrifugiranje → sediment → metanol (fiksacija) → bojenje po Giemsi
- Uzorci tkiva/organa → imprint preparat → metanol (fiksacija) → bojenje po Giemsi
- Elektronska mikroskopija

Dijagnostika

Direktna dijagnostika – detekcija antigena

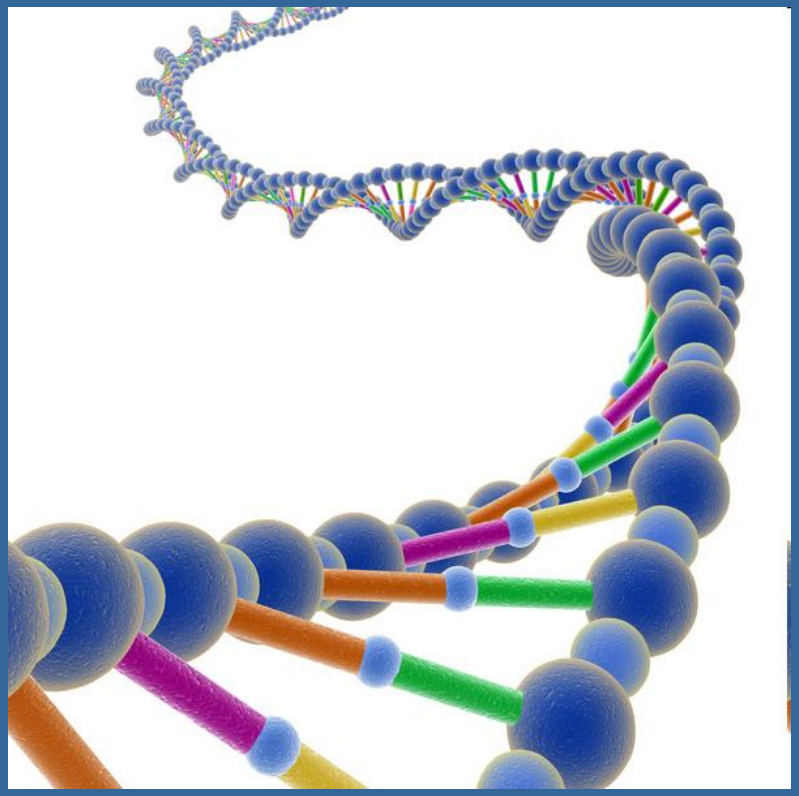
- Uzorci – bioptati, kultura stanica
- DFA – koristi monoklonalna anti *T. gondii* protutijela obilježena fluorescein-isotio-cijanatom
- Imunoperoksidazna tehnika

Dijagnostika

Direktna dijagnostika – metoda detekcije nukleinske kiseline

- PCR
- Dijagnostika kongenitalne infekcije, encefalitisa, očne toksoplazmoze
- Komercijalni kitovi za sada nisu dostupni
- Primer - B1 gen *T. gondii*
- PCR iz amnionske tekućine

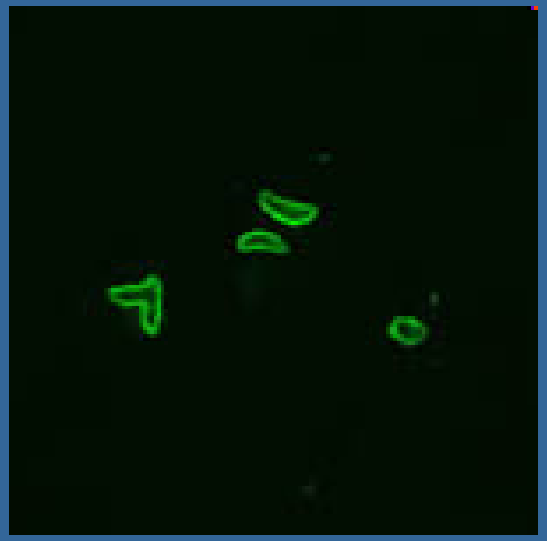
  -dijagnostika intrauterine infekcije – izbjegavanje invazivnih procedura po fetus
- PCR iz likvora, krvi, urina, placente, fetalnog tkiva
- Osjetljivost -85 %, specifičnost 100 %



Dijagnostika

Direktna dijagnostika – izolacija

- Na pokusnoj životinji (miš) – 4 - 6 tjedana – serologija, pregled mozga miša
- Na kulturi stanica (24 – 96 sati) – bojenje po Giemsi, DFA

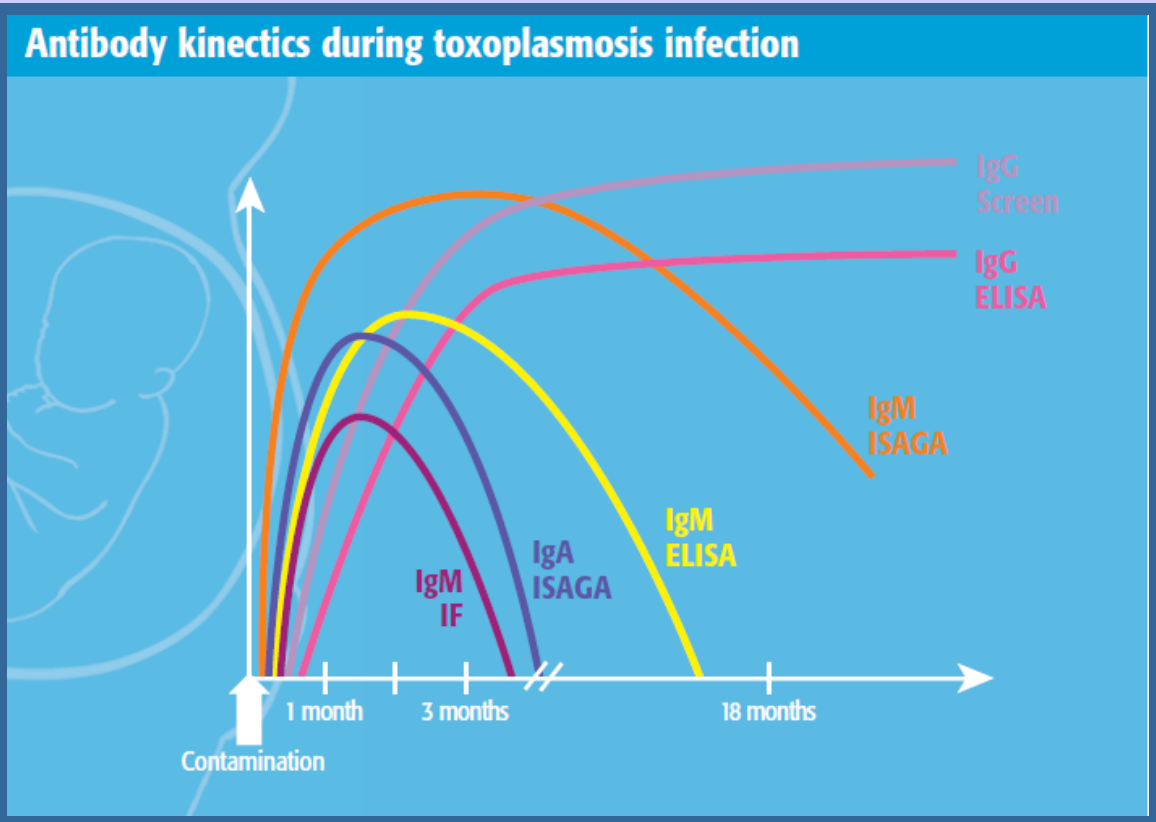


Dijagnostika

Serološka dijagnostika

- Najčešće se koristi u dijagnostici toksoplazmoze
- Sabin Feldman dye test – zlatni standard
- Na tržištu brojni komercijalni testovi (aglutinacija, IFA, EIA, ELFA, ISAGA, WB)

Dijagnostika – serološka dijagnostika



Slika preuzeta: www.biomerieux.com/toxoplasmosis

Dijagnostika

Serološka dijagnostika – IgG protutijela

- 1-2 tjedna nakon infekcije
- Najveća vrijednost 1-2 mjeseca
- Prisutna u niskom titru čitavog života
- Titar IgG protutijela izražava se u IU/ml

Dijagnostika

Serološka dijagnostika – IgG protutijela

- EIA (Enzyme linked immunosorbent assay)
- ELFA (Enzyme linked fluorescent assay)
- EIA / ELFA test aviditeta IgG protutijela
- Niski, granični, visoki aviditet
- Visoki aviditet – infekcija “starija” od 4-6 mjeseci
- Niski aviditet – infekcija “mlađa” od 4-6 mjeseci
- Biološka varijabilnost !!! – visoki aviditet garancija “stare” infekcije, niski aviditet upućuje na “mlađu” infekciju

Dijagnostika

Serološka dijagnostika – IgM protutijela

- Par dana nakon infekcije
- Prisutni u serumu › godine dana
- Samo nalazom IgM protutijela NE MOŽE se postaviti dijagnoza akutne toksoplazmoze

Dijagnostika

Serološka dijagnostika – IgM protutijela

- IgM Immunosorbent Aglutination Assay (IgM ISAGA)
- Komercijalno dostupan
- Najosjetljiviji test za određivanje IgM protutijela, visoko specifičan
- Vremenski i tehnički zahtjevan

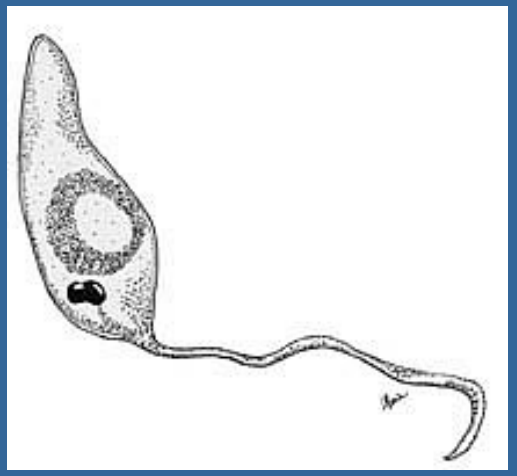
Dijagnostika

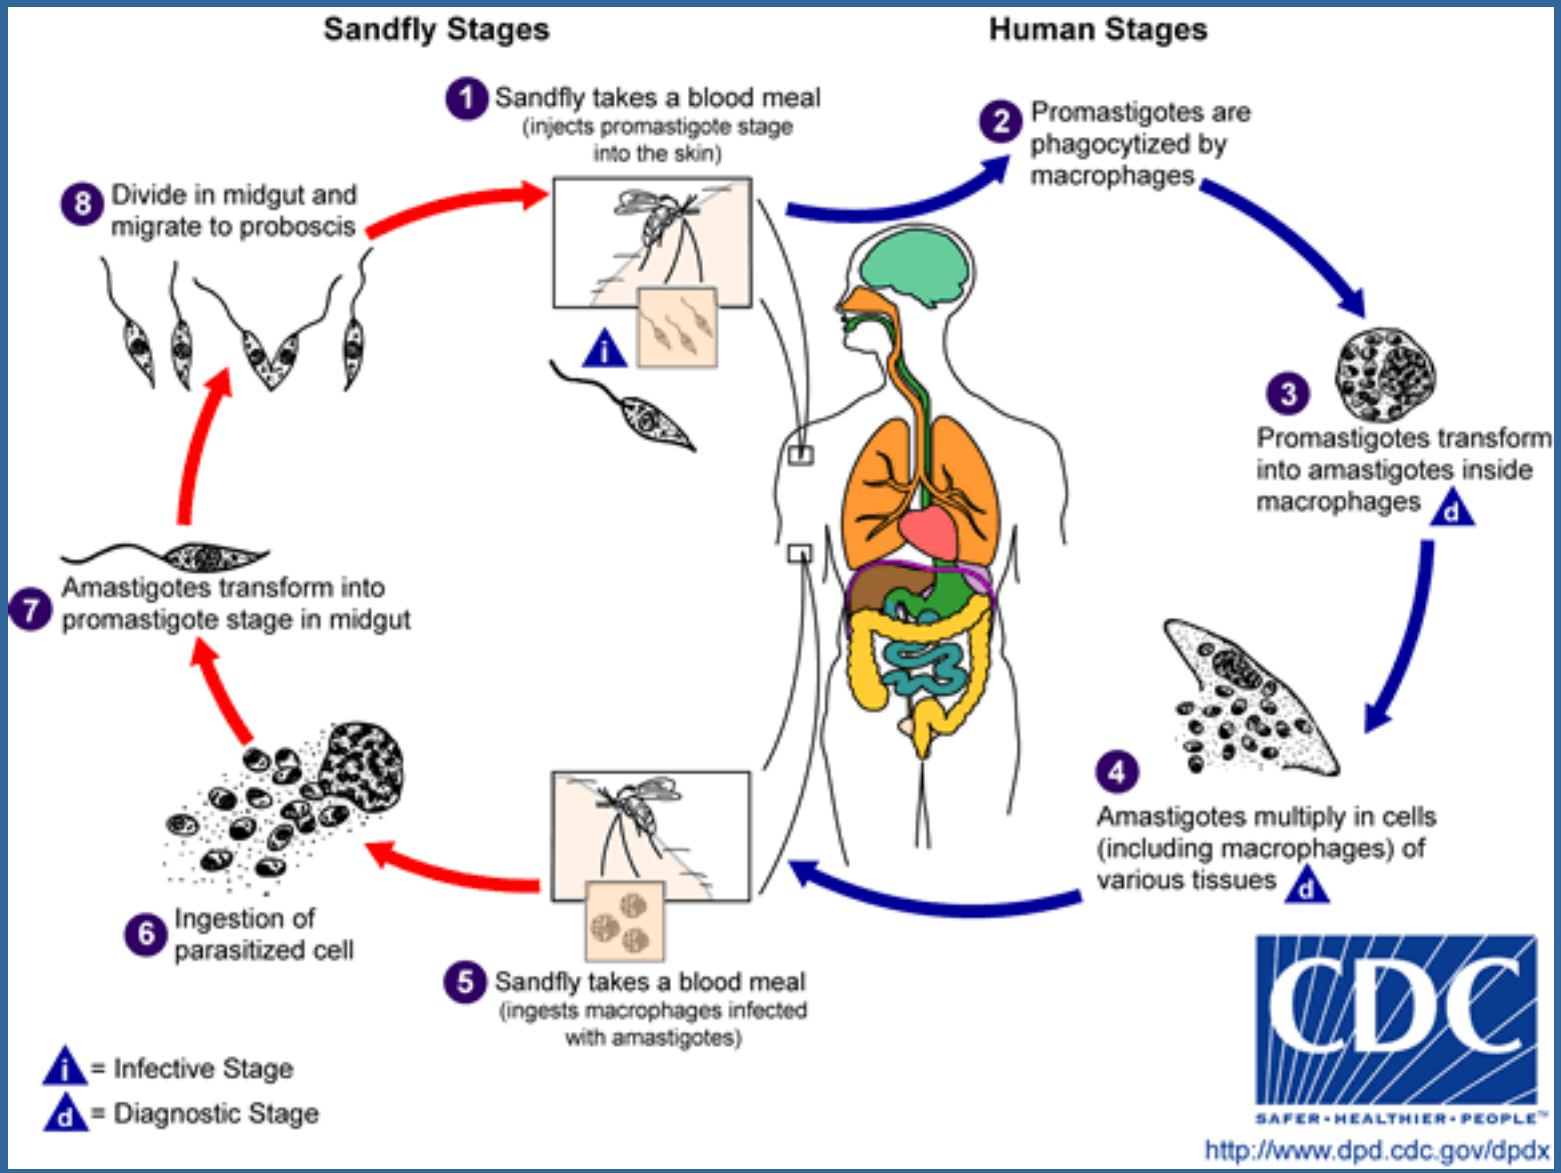
Serološka dijagnostika – IgA protutijela

- Dinamika kao i IgM protutijela
- Komercijalno dostupan kit (EIA, ISAGA)
- Prednost – veća osjetljivost
- Dijagnostika akutne i kongenitalne toksoplazmoze

Leishmania

- Hemoflagelat
- Vektor-nevid iz roda Phlebotomus (Stari svijet),Lutzomyia (Novi svijet)
- Antropozoonoza





Sandfly Stages

Leishmania

Klinička slika

- Visceralna lišmaniaza (kala azar, dum dum groznica)
  L.donovani,L.infantum,L.chagasi
- Kutana lišmaniaza (orientalni ulcus)
  L.maior,L.tropica,L.aethiopica
- Američka mukokutana lišmaniaza (espundia,chiclero ulcus)
  L.mexicana complex, L.brasiliensis complex, L.peruviana

Leishmania

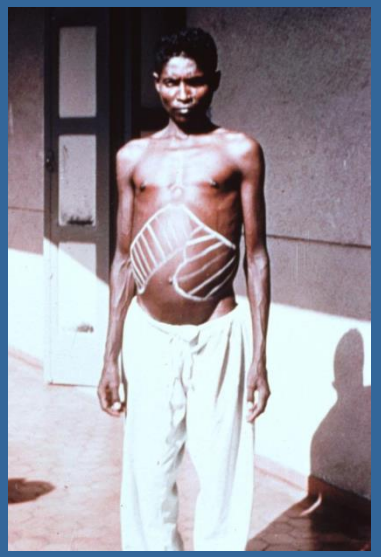
Visceralna lišmaniaza

Inkubacija-nekoliko tjedana do godinu dana

Postepeni nastup povišene temperature, proljev, pancitopenija, pojavljuju se tresavice i znojenja, inapetenca (nespecifični simptomi)

Hepatosplenomegalija, oštećenje bubrega

Tamna pigmentacija kože (crna smrt)



Leishmania

Kožna lišmaniaza

Inkubacija-2 tjedna do 2 mjeseca

Crvena papula na mjestu uboda nevida (svrbež,rast)→ ulcus (krusta,serozni iscjedak)→sek.bakterijska infekcija→ožiljak

Leishmania

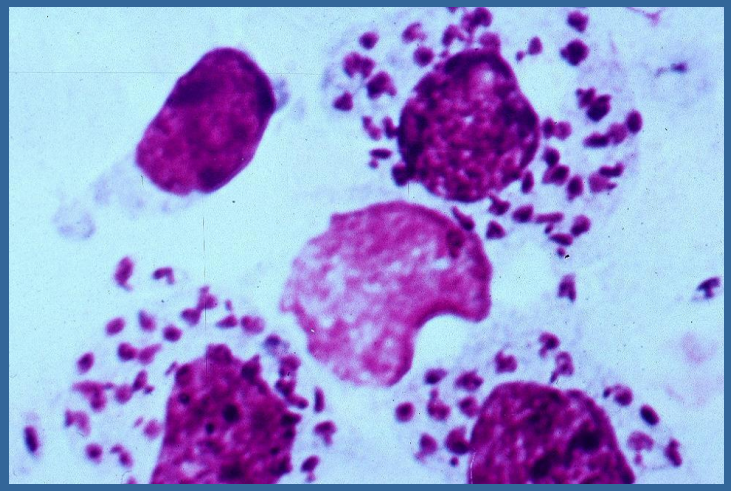
Mukokutana lišmanioza

Inkubacija-2 tjedna
do 2 mjeseca
Destrukcija mukoznih membrana i prileže ćih struktura
Teške i mutilirajuće promjene, smrt

Leishmania

Dijagnostika

- Nalaz uzročnika u aspiratu koštane srži (mikroskopija, kultura-NNN podloga)
- PCR
- Serologija (ITFA, ELISA)
- Western blot



Trypanosoma

- Hemoflagelat
- **Afrička tripanosomoza** (bolest spavanja)

  T.brucei gambiense

  T.bruci rhodensiense-enzootija
- **Američka tripanosomoza** (Chagasova bolest)

  T.cruzi

Trypanosoma brucei

- Endemska u subsaharskoj Africi
- Vektor ce ce muha (Glossina)
- WHO-50.000 inficiranih godišnje

Trypanosoma brucei

- **1.stadij-febrilno glandularni**

  ulcus

  povišena temperatura,tresavica,bolovi u zglobovima i mišićima, edemi,astenija,generalizirana

  limfadenopatija (Winterbottomov znak),miokarditis,anemija,trombocitopenija
- **2.stadij-meningoencefalitični**

  konvulzije,somnolencija,apatija,koma,smrt

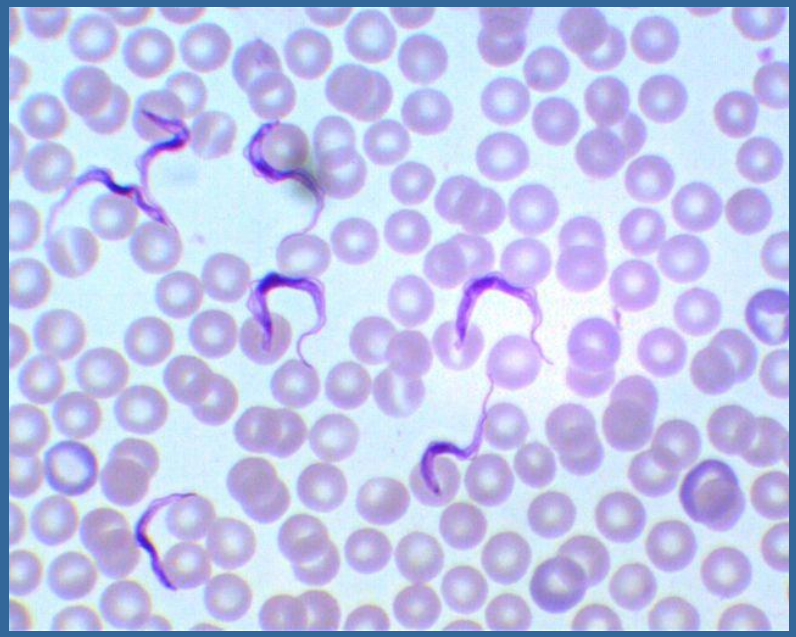
Trypanosoma brucei

- Direktna

  Nalaz tripanosoma u krvi, aspiratu limfonoda, likvoru (krvni razmaz, gusta kap)

  Poželjna koncentracija uzorka, više uzoraka

  Kultivacija (miš)
- Indirektna - serologija



Trypanosoma cruzi

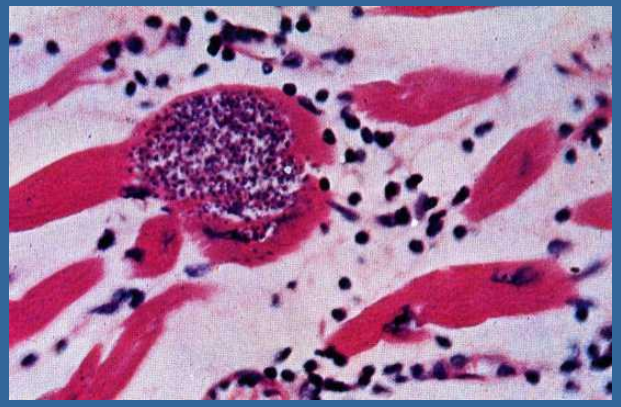
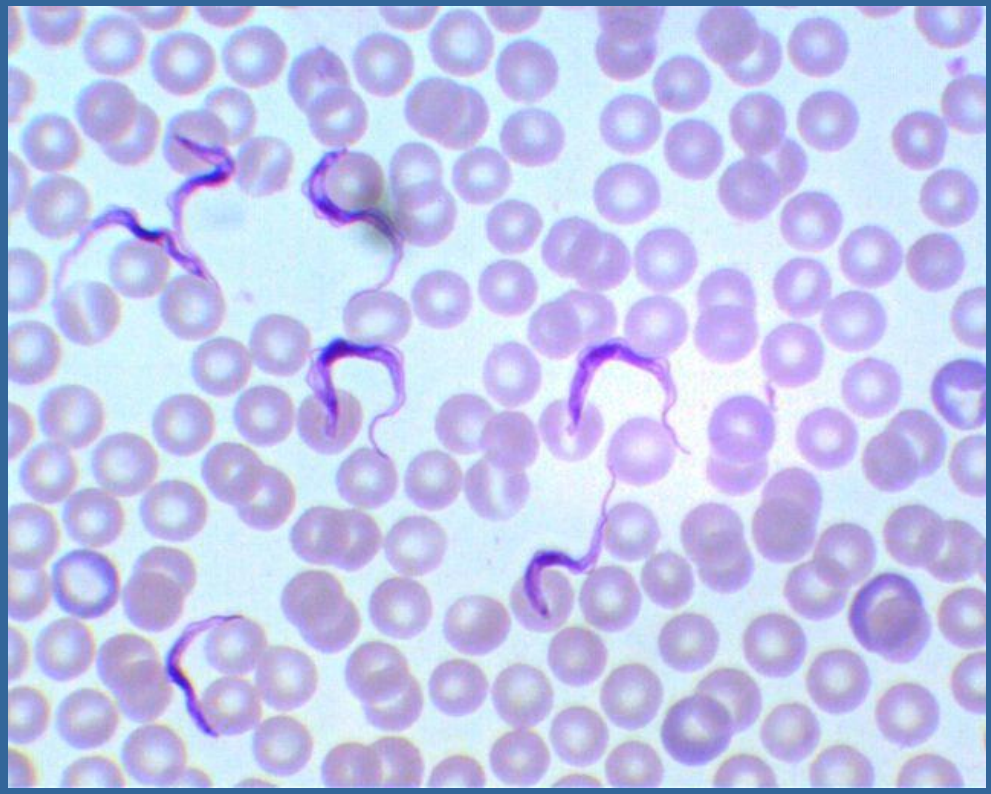
Trypanosoma cruzi

- Direktna
- Krvni razmaz, gusta kap (koncentriranje uzorka)
- Biopsija limfonoda, jetre, slezene, koštane srži -amastigoti
- Ksenodijagnostika
- PCR
- Indirektna - Serologija (ITFA, ELISA, WB)

Trypanosoma cruzi

Trypanosoma cruzi





Slobodno živuće amebe

- Infekcije u ljudi i životinja
- Nisu česte
- Životno ugrožavajuće ili s teškim posljedicama
- Obolijevaju imunodeficijentne osobe, ali i zdrave osobe

Slobodno živuće amebe

Organizmi

- Naegleria
- Balamuthia
- Sappinia
- Acanthamoeba

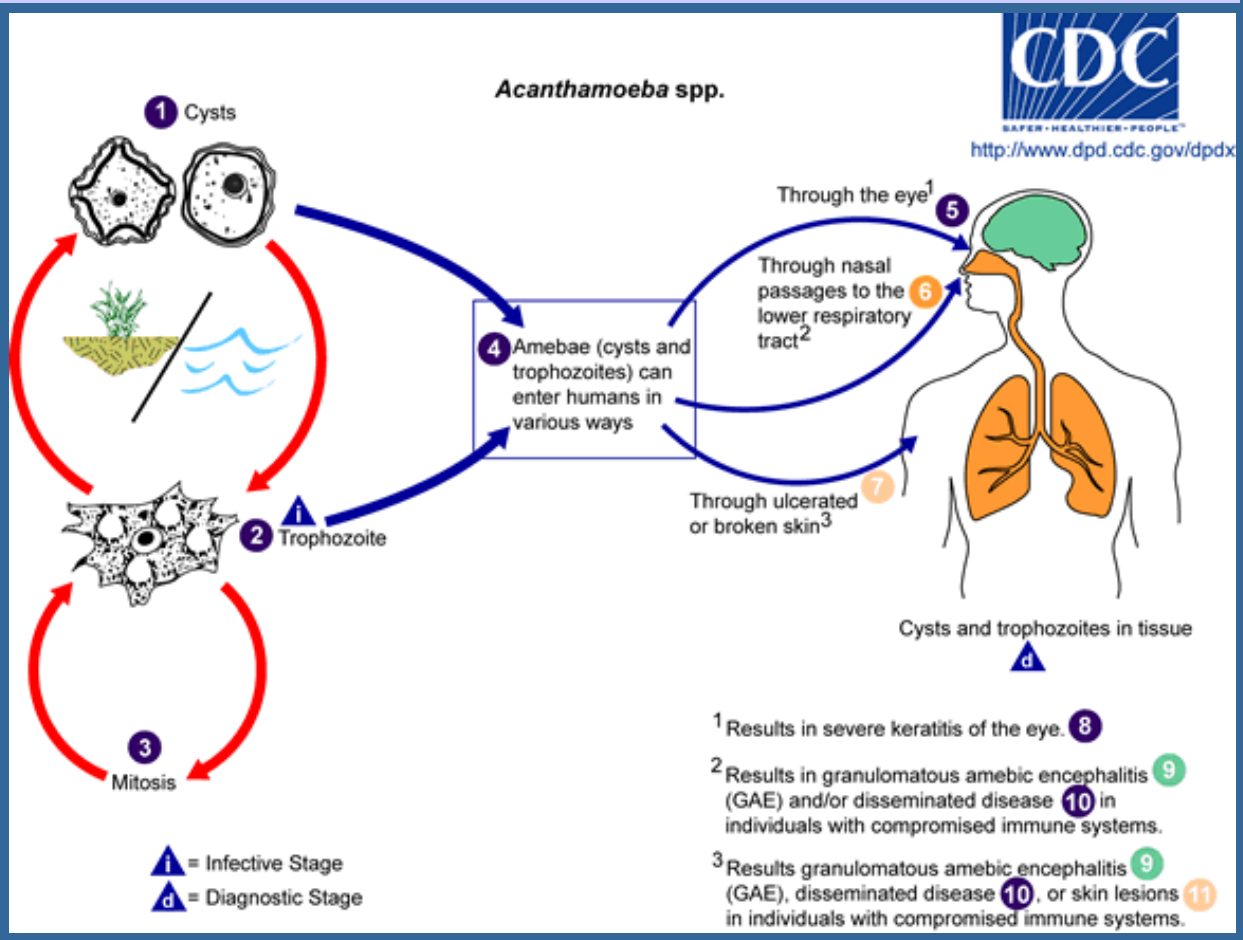
Slobodno živuće amebe

- Razlikuju se od drugih patogenih protozoa
- Slobodni život u prirodi
- Primarno nisu parazitarni organizmi – bolest – “pravo vrijeme na pravom mjestu”
- Nemaju vektora
- Nema kliconoštva
- Ne postoji povezanost između loše sanitacije i širenja infekcije

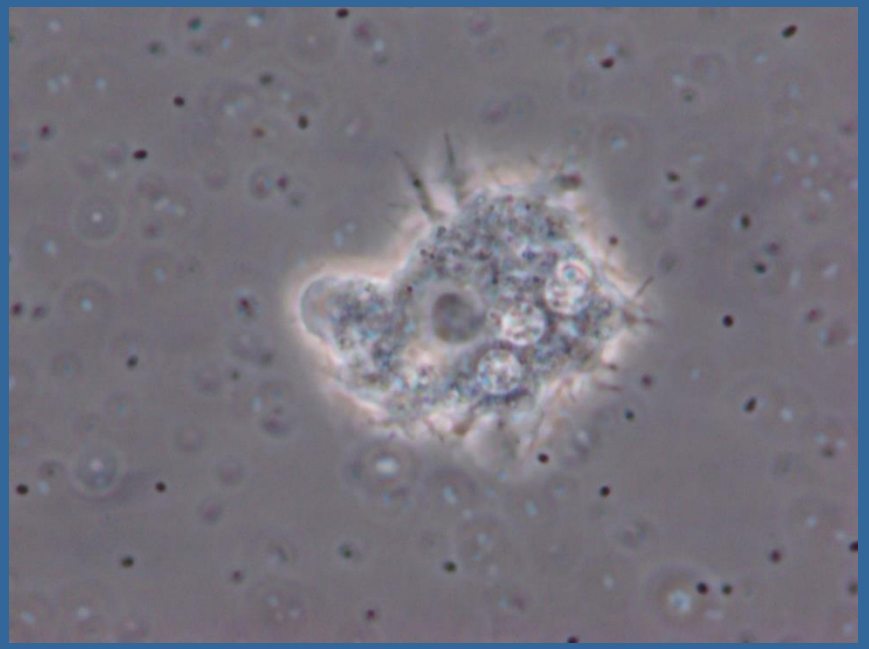
Slobodno živuće amebe

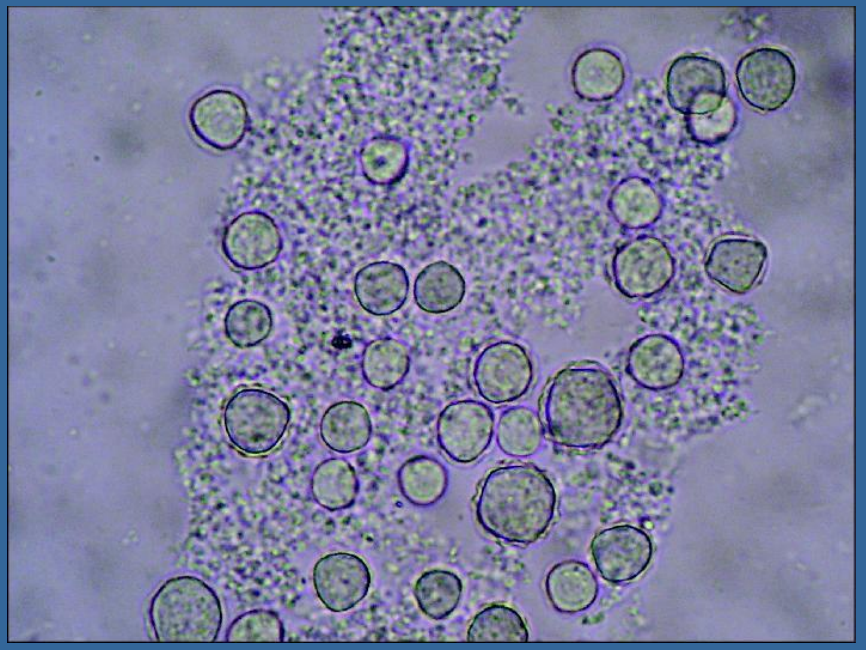
Sindrom, bolest	Uzročnik
Primarni amebni meningoencefalitis (PAM)	*Naegleria sp.*
Granulomatozni amebni encefalitis (GAE)	*Acanthamoeba sp.* *Balamuthia mandrilaris* *Sappinia diploidea*
Diseminirana granulomatozna amebna bolest (DGAB)	*Acanthamoeba sp.* *Balamuthia mandrilaris*
Amebni keratitis	*Acanthamoeba sp.*

Acanthamoeba



Acanthamoeba





Acanthamoeba

Laboratorijska dijagnostika-uzorci

- Strugotina, bioptat rožnice, suze
- Kontaktna leća, posudica i otopina za leće-indirektna dijagnostika!
- Bris oka nije adekvatan uzorak
- Laboratorijska obrada uzoraka unutar 24 sata (optimum 2-3 sata)
- Uzorak se može par sati ostaviti stajati na sobnoj temperaturi, ne stavljati u frižider ili zamrzivač

Acanthamoeba

Laboratorijska dijagnostika

- Direktna (mikroskopija, kultivacija, molekularna dijagnostika)
- Indirektna – serološka dijagnostika

CONTACT LENSES AND WATER DON'T MIX

MICROSCOPIC ORGANISMS FOUND IN TAP WATER MAY CAUSE EYE INFECTIONS IN CONTACT LENS WEARERS IF PROPER CARE IS NOT FOLLOWED.

TIPS FOR SOFT CONTACT LENS WEARERS:

- Carefully wash and dry hands before handling lenses.
- Don't use tap water to rinse contact lenses or storage cases.
- Take lenses out before doing any activity involving water like showering, using a hot tub or swimming.
- Talk to your eye care professional about proper contact lens cleaning and storage methods.

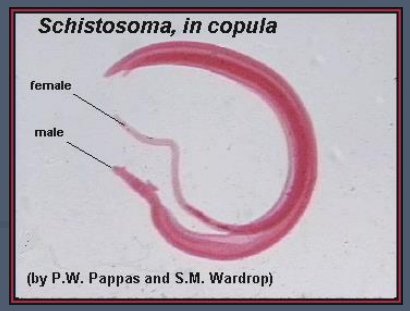
Laboratorijska dijagnostika plosnatih crva

Koljeno Platyhelminthes



- Plosnati crvi – višestanične životinje nalik na list ili vrpcu, rjeđe valjkasta oblika, bilateralno simetrični, građeni od triju zametnih listića
- Nemaju tjelesne šupljine, mnogi nemaju probavni sustav

Koljeno Platyhelminthes

Tri razreda

- Turbellaria – slobodne životinje
- Trematoda – metilji
- Cestoidea - trakavice

Trematoda (metilji)

- Plosnati, oblik poput lista vrbe
- Oralna i ventralna prijanjalka
- Većina dvospolci
- U životnom ciklusu svima potreban prijelazni domaćin (prvi bez iznimke puževi) – aseksualni životni ciklus
- Drugi prijelazni domaćini različiti
- Jaja metilja - operkulum (Schistosoma iznimka)

Trematoda (metilji)

Medicinski značajni predstavnici

- Fasciolopsis buski – veliki crijevni metilj
- Fasciola hepatica - ovčji jetreni metilj
- Opisthorchis (clonorchis) sinensis – kineski jetreni metilj
- Paragonimus westermani – plućni metilj
- Schistosoma spp. - krvni metilji

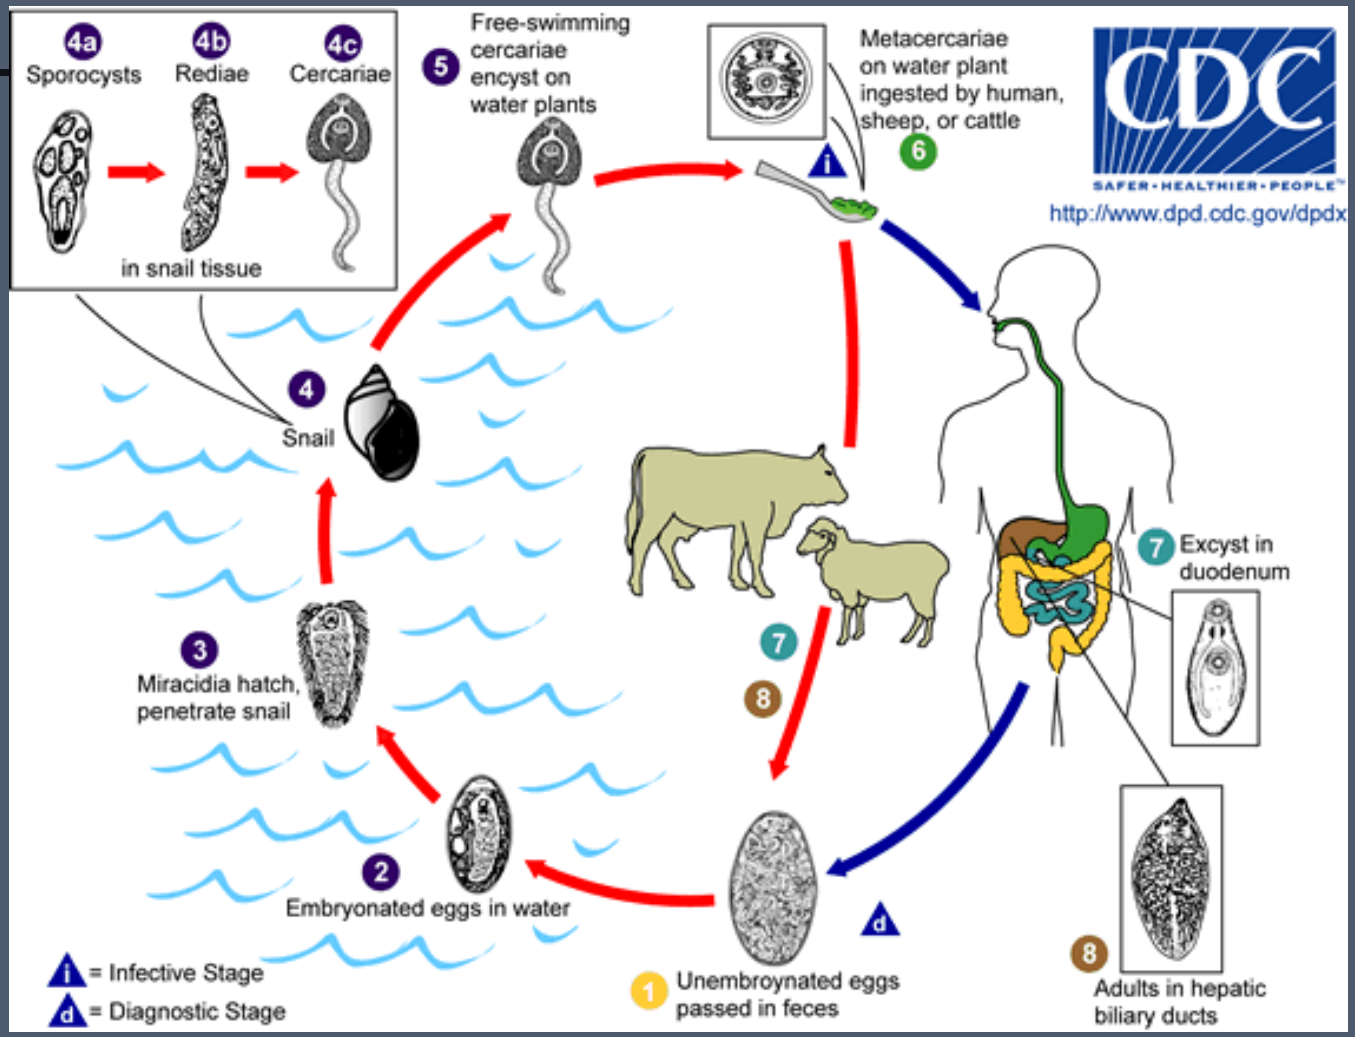
Fasciola hepatica

- Fasciola hepatica – ovčji jetreni metilj
- Uzročnik fascioloze
- Infekcija u oko 50 zemalja na svim kontinentima
- Prevaljencija WHO 1995. 2 milijuna ljudi

Fasciola hepatica

- Plosnat, poput lista breze, dužina 2-5 cm, širina 1 cm
- Adulti parazitiraju u žučnim vodovima
- Jajašca – 130x85 μm, zlatno žute boje, s operkulumom

Fasciola hepatica



Fasciola hepatica

Klinička slika

- Asimptomatska
- Simptomatska –

  akutna faza: bolovi u abdomenu, hepatomegalija, febrilitet, leukocitoza, eozinofilija

  kronična faza: hepatokolangitički simptomi (žutica), anemija
- Migracija parazita u druge organe

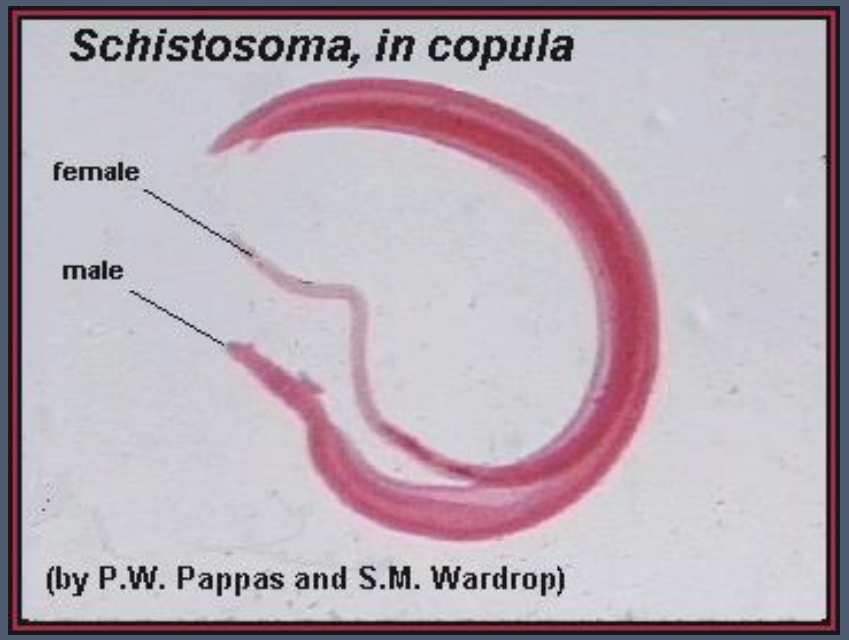
Fasciola hepatica

Laboratorijska dijagnostika

- Uzorci: stolica, duodenalni sok, krv
- Detekcija jaja (2-3 mjeseca nakon infekcije)
- Serologija (EIA, WB)

Schistosoma

- Krvni metilji
- Uzročnik šistosomoze, bilharcioze
- Endemska u tropskim i subtropskim zemljama Afrike, Južne Amerike i Azije (80 ak zemalja)
- Prevalencija WHO 2008 god. 200 milijuna ljudi



Schistosoma

- S. hematobium
- S. mansoni
- S. japonicum
- S. intercalatum
- S. mekongi

Distribution of Schistosomes

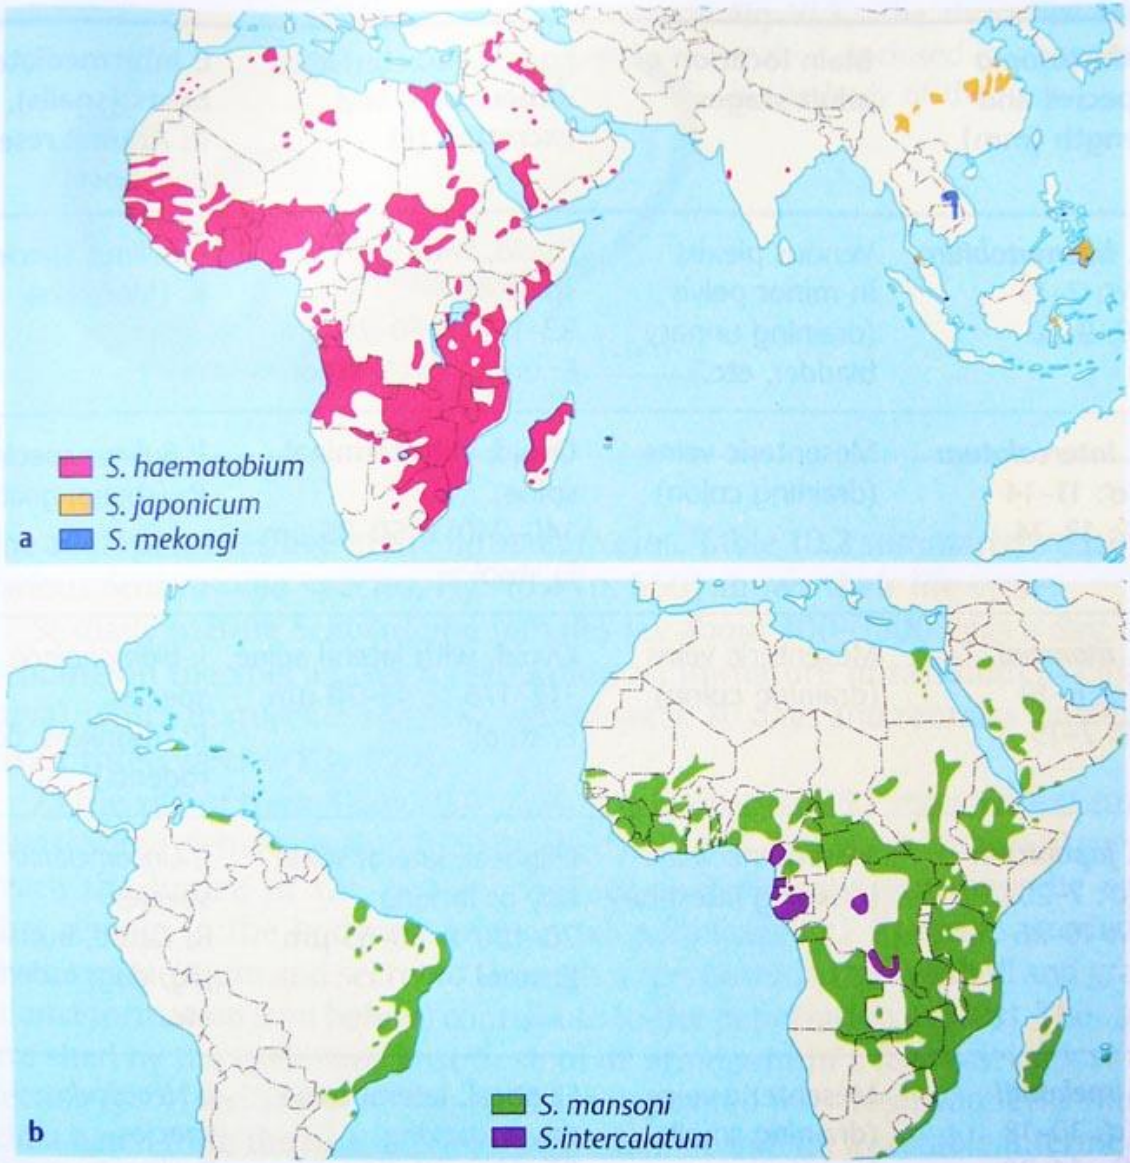


Fig. 10.2 **a** *Schistosoma hematobium*, *S. japonicum*, and *S. mekongi*; **b** *S. mansoni* and *S. intercalatum* (according to *WHO Technical Report Series* No. 830. Geneva: World Health Organization; 1993).

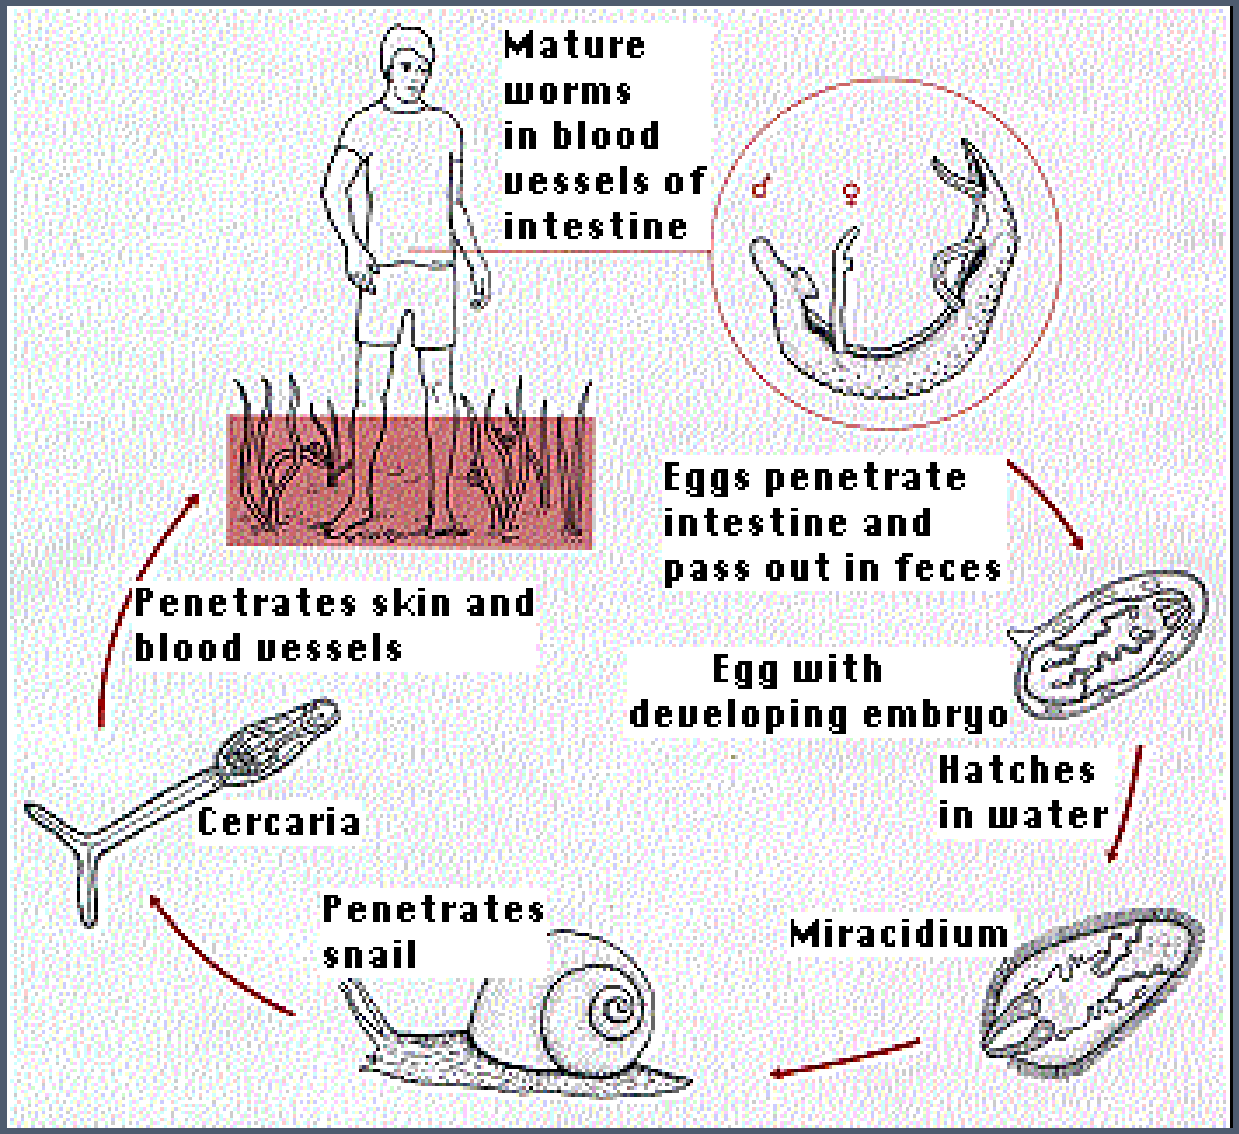
Schistosoma

- Adulti žive u lumenu vena
- Zrele ženke legu 100 – 3500 jaja na dan
- Jaje sadrži nezreli miracidijum (cilijarna larva)
- Izlučuju se mokraćom i/ili stolicom



Mature worms in blood uessels of intestine
♂
♀
Eggs penetrate intestine and pass out in feces
Egg with developing embryo
Hatches in water
Miracidium
Penetrates snail
Cercaria
Penetrates skin and blood uessels

Schistosoma

- Kliničke manifestacije
- Infekcija se može podjeliti u nekoliko faza

1. Faza penetracije (asimptomatska, simptomatska – svrbež, crvenilo, papule)
2. Akutna faza (asimptomatska, simptomatska- Katayama groznica)

2-10 tjedana nakon infekcije

febrilitet, glavobolja, bolovi u mišićima, urtikarija, bolovi u abdomenu, hepatosplenomegalija, limfadenopatija, eozinofilija

Schistosoma

3. Kronična faza

2 mjeseca –

Započinje ovipozicijom

50 % jaja ostane u tkivima

Hematogena diseminacija – CNS, koža

Formiranje granuloma - vezivo

Schistosoma

Lokalizacija lezija

1. Urinarna - S. hematobium
2. Intestinalna – S. mansoni, S. japonicum, S. mekongi
3. Hepatosplenična – S. japonicum, S.mansoni
4. Pulmonarna – S. mansoni
5. Cerebralna – S. japonicum

Schistosoma

Laboratorijska dijagnostika

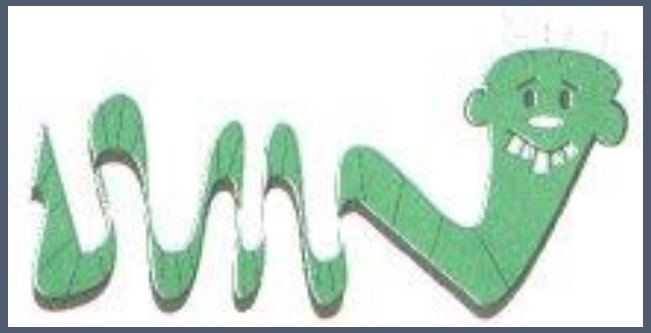
- Nalaz jaja u stolici, urinu
- Biopsija crijeva, mokraćnog mjehura
- Serologija (EIA, WB)
- Miracidijski test

Cestoidea (trakavice)

- Poput trake izduženi, člankovito građeni plosnati crvi
- Adulti: nametnici crijeva
- Građa: scolex, proglotide
- Dvospolci
- Jaja – nemaju operkulum, sadrže embrio
- Nemaju probavni sustav
- Kompleksni životni ciklusi

Cestoidea (trakavice)

Medicinski značajne trakavice:



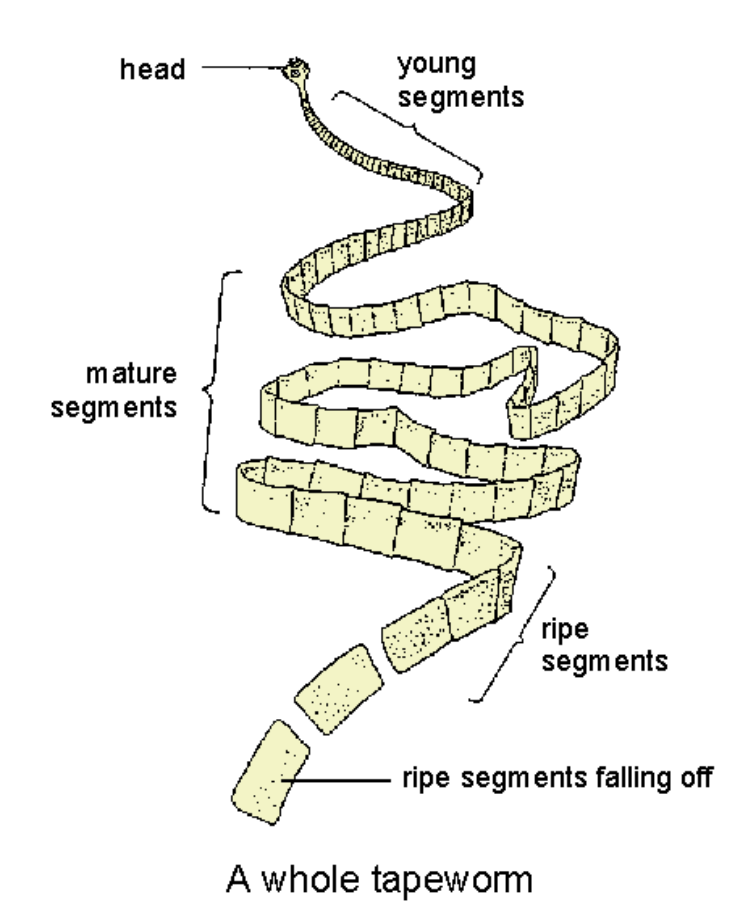
- Taenia solium
- Taenia saginata
- Diphyllobothrium latim
- Echinococcus granulosus
- Echinococcus multilocularis
- Hymenolepis nana
- Hymenolepis diminuta

Taenia

- Grč. traka
- Scolex – četiri acetabula
- Gravidni članci – raščlanjeni uterusi
- Adulti – žive u tankom crijevu mesoždera i sveždera
- Vrste:

  Taenia saginata

  Taenia solium



Taenia saginata

- Goveđa trakavica
- Rasprostranjena širom svijeta
- Prevalencija: 40-60 milijuna ljudi
- Prevalencija cisticerkoze u goveda

  Europa 0,3 %

  Mexico – više od 20%

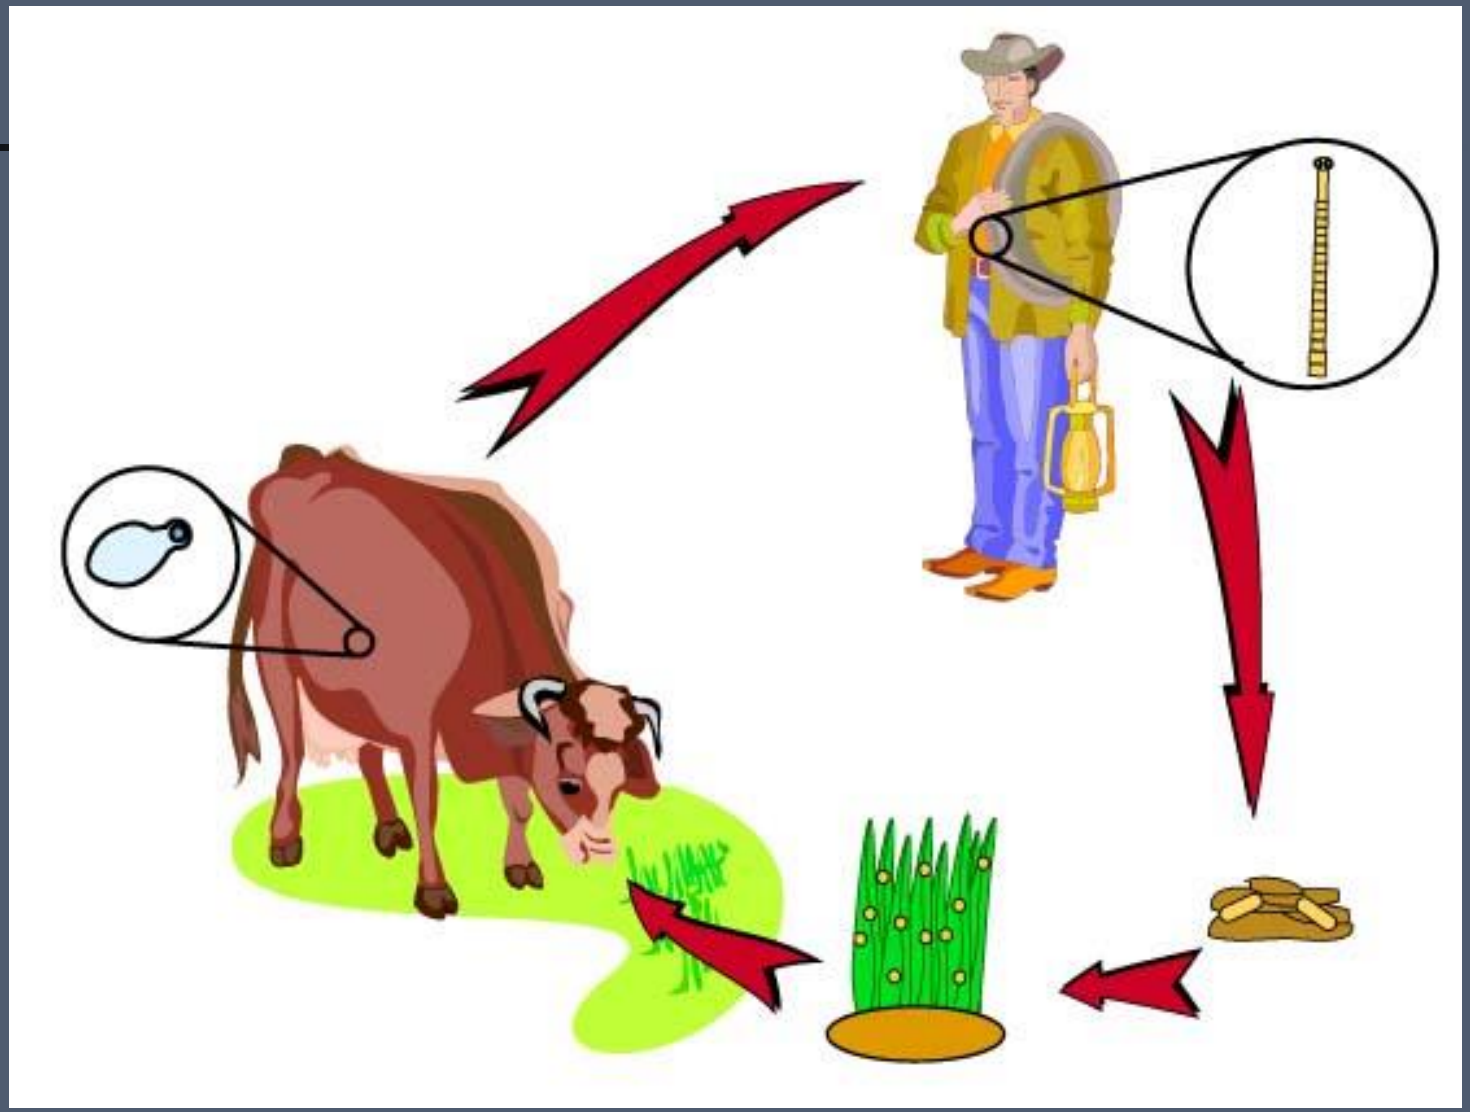
Taenia saginata

- Nametnik tankog crijeva, češća od T. solium
- Veličina do 10 metara
- Četvrtasti zaobljen skolex, 4 prisisne zdjelice (nema rosteluma, niti vijenca kukica)
- Proglotide duguljaste
- Razgranat uterus s 15-20 kolateralnih ogranaka

Taenia saginata

- Jaja – 30-40 µm, okrugla, debela, radijarno isprugana ljuska smeđe boje
- Sadrže onkosferu
- Otporna u vlažnoj sredini (nekoliko mjeseci)

Taenia saginata



Taenia saginata

Klinička slika

- Asimptomatska
- Simptomatska infekcija: mučnina, povračanje, mršavljenje, bolovi u abdomenu, proljev, zatvor, smanjen ili povećan apetit

Taenia saginata

Laboratorijska dijagnostika:

- Nalaz proglotida i jaja u stolici
- Diferencijacija vrste ponekad nemoguća – PCR
- Detekcija antigena u stolici – EIA
- Serologija na cisticerkozu – za isključenje infekcije trakavicom T. solium

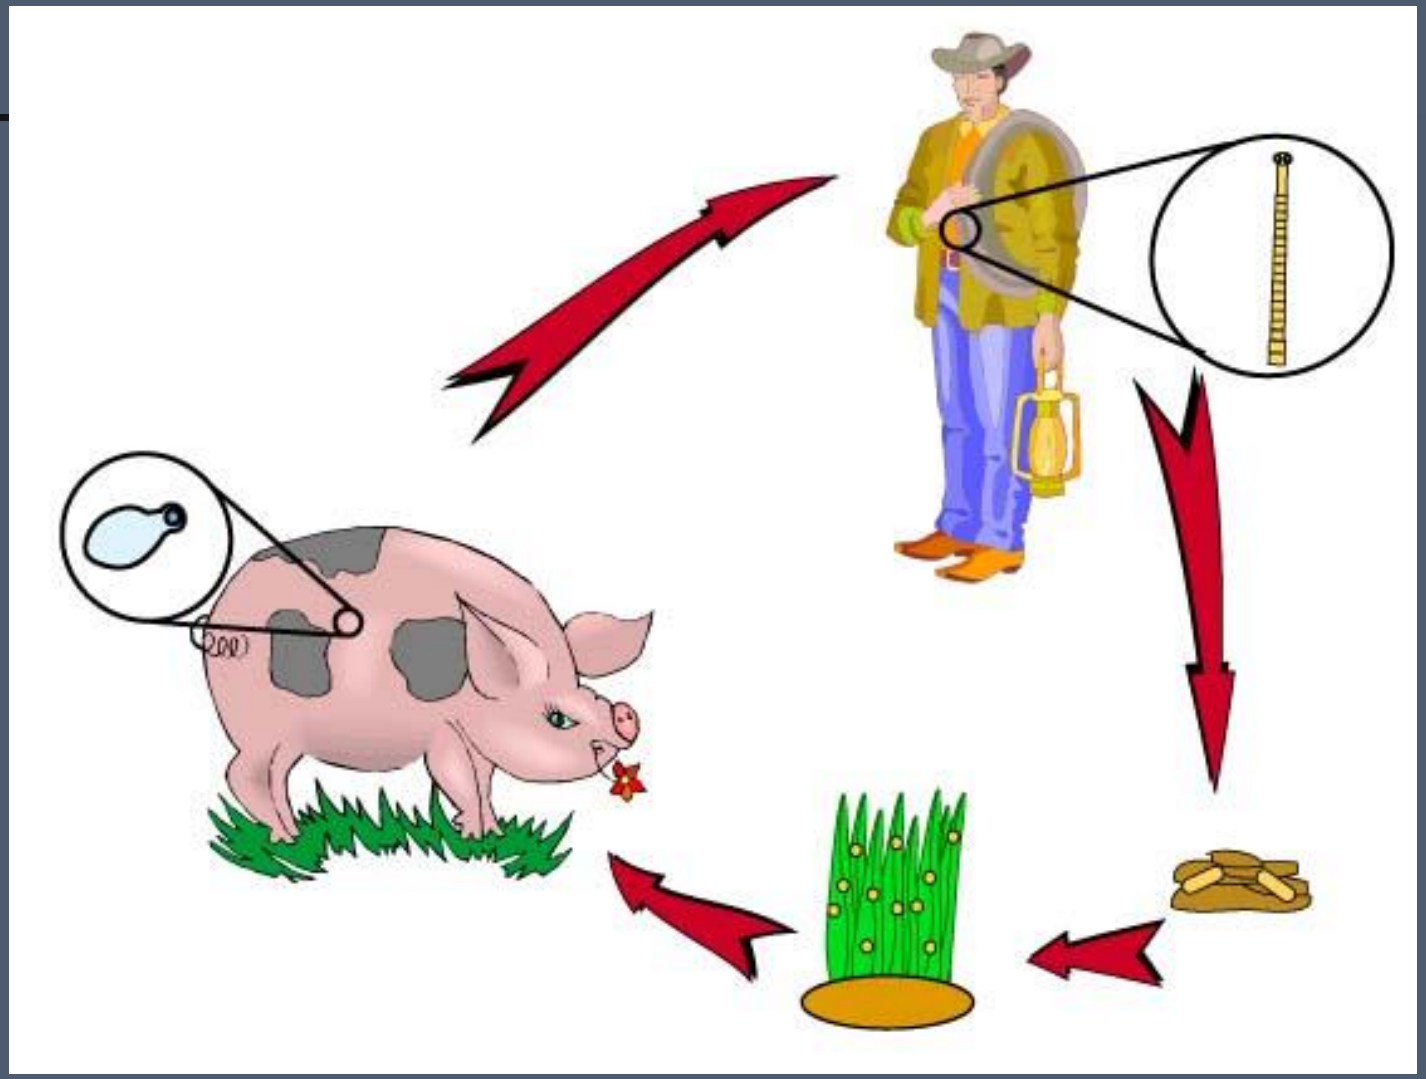
Taenia solium

- Svinjska trakavica
- Uzročnike T. solium tenioze (cisticerkoze)
- Endemska u Centralnoj i Južnoj Americi, Africi i Aziji, sporadična pojava u SAD-u i Europi
- (Mexico 0,1-7 % ruralne populacije nosioci adultnog parazita, 25 % svinja nosioci ličinki)

Taenia solium

- Nametnik tankog crijeva čovjeka
- Dužina 2-7 m, 1 000 članaka
- Skolex – ima rostelum s kukicama
- Proglotide – uterus se grana u 7-12 bilateralnih ogranaka
- Jaja morfološki jednaka onima T. saginate

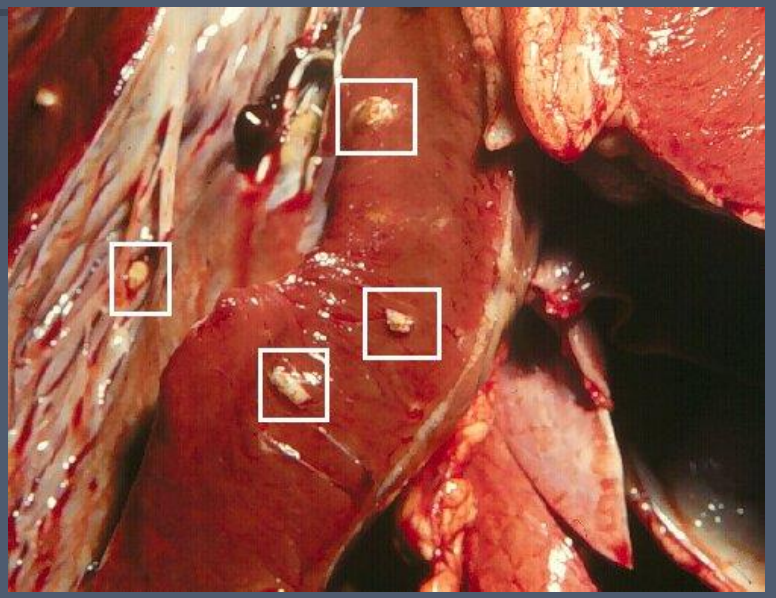
Taenia solium



Taenia solium

- Klinička slika
- Asimptomatska
- Simptomatska:
- Adulti – osjećaj težine i boli u trbuhu, proljev, zatvor, povračanje, slab apetit, mršavljenje
- Ličinke (cisticerkoza) – ovisno o broju i smještaju ličinki

  Mozak, oko, potkožno tkivo, srce, skeletna muskulatura



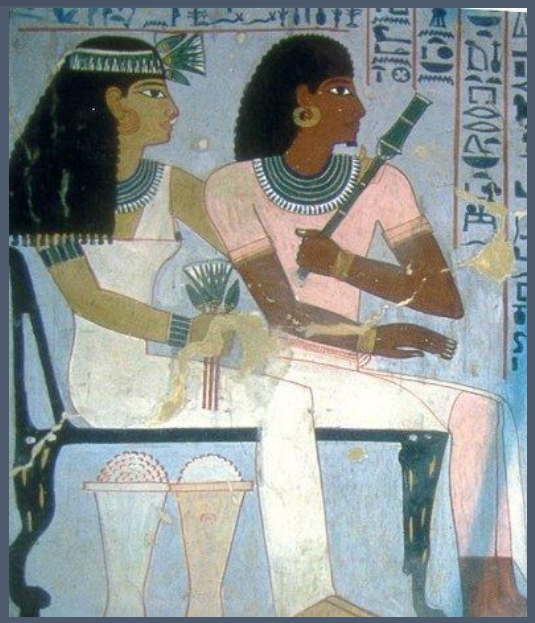
Taenia solium

Laboratorijska dijagnostika

- Nalaz jaja, proglotida u stolici (nativni preparat, MIFC, grahamova metoda)
- Detekcija antigena (ELISA)
- Serologija: EIA, Western blot

Echinococcus granulosus

- Uzročnik ehinokokoze
- Mala trakavica (4-7 mm, skolex i 2-6 proglotide)
- Rasprostranjen širom svijeta



Echinococcus granulosus

- Najznačajniji konačni domaćin – pas
- Herbivorni i omnivorni vertebrati – prijelazni nosioci

DOI: https://doi.org/10.3201/eid2602.181826

Alveolar echinococcosis is a parasitic disease caused by the tapeworm larval stage of *Echinococcus multilocularis*. This zoonotic disease has not been known to occur in Croatia. We report a confirmed case of human alveolar echinococcosis in a patient in Croatia who had never visited a known *E. multilocularis*–endemic area.

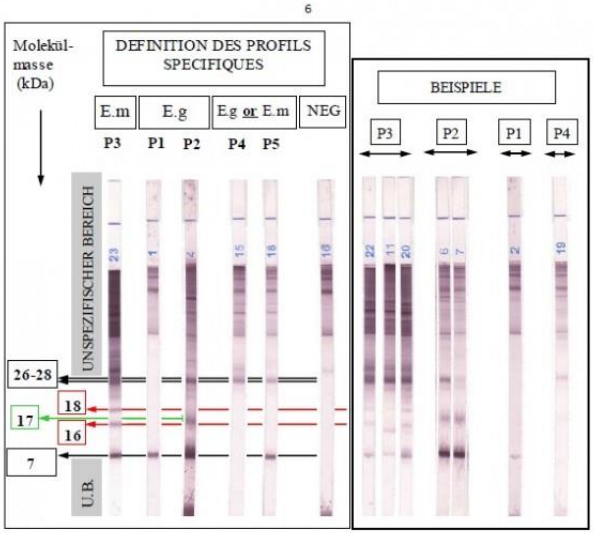

Abb. 1: Beispiele positiver und negativer Ergebnisse

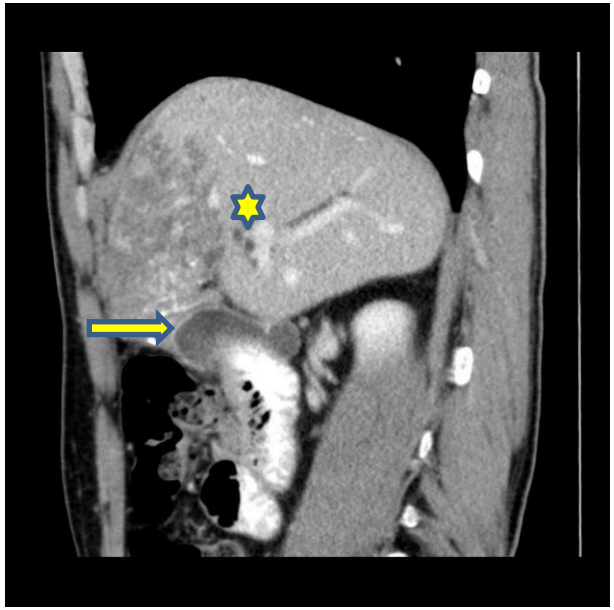
Patient 1 (2017): male, 63 y.

Figure. Computed tomography scan of a patient diagnosed with alveolar echinococcosis, Croatia. Arrows indicate right pleural effusion, lung lesions, an enlarged right adrenal gland, and a 13 × 12 × 12 cm lesion in the liver caused by *Echinococcus multilocaris*.

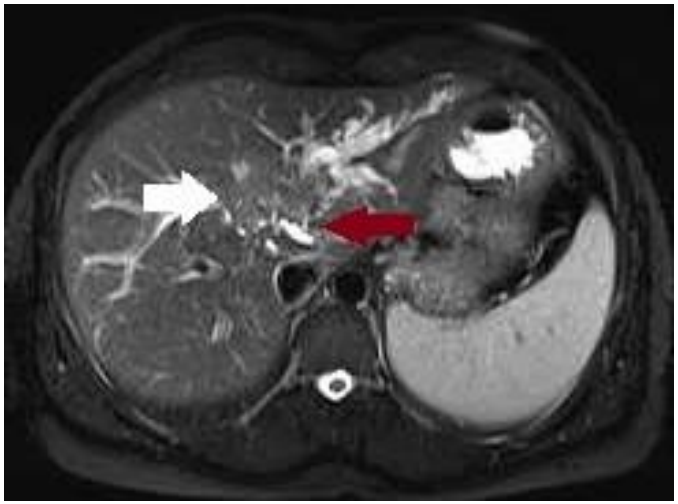
Patient 2 (2019): male, 64 y.

Patient 2: a sagittal postcontrast multidetector computed tomography (MDCT) scan in the late arterial phase demonstrated an infiltrating tumorlike liver mass in the left liver lobe with irregular margins and heterogeneous enhancement, infiltrating a gall bladder (arrow). A moderate dilatation of the intrahepatic bile ducts was noted (star).

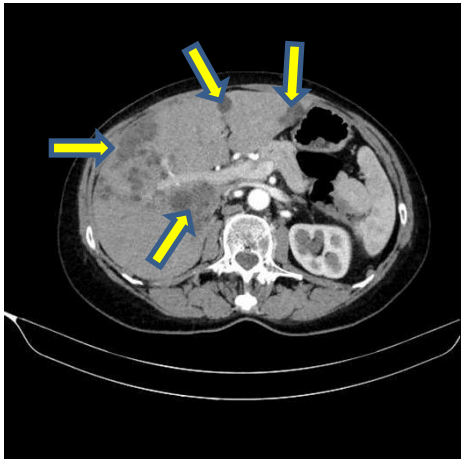


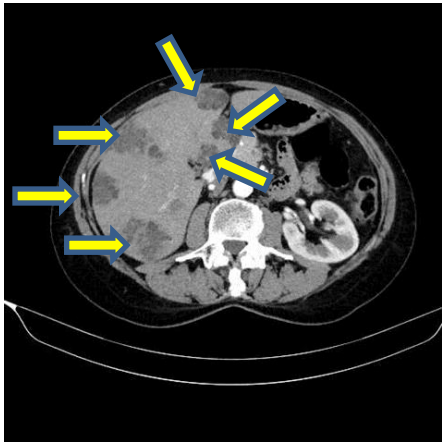
Patient 3 (2021): female, 37 y.

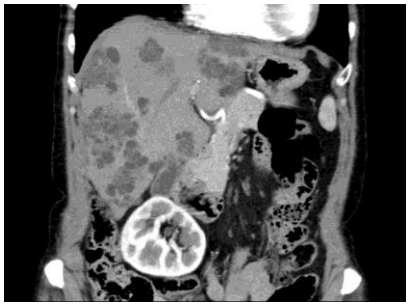
Patient 3: magnetic resonance imaging (MRI) revealed obstruction of the left and right hepatic duct with a hypovascular focal lesion measuring 4 cm in the IV.A and VIII. liver segment (white arrow). The lesion infiltrates a patent median hepatic vein (red arrow).



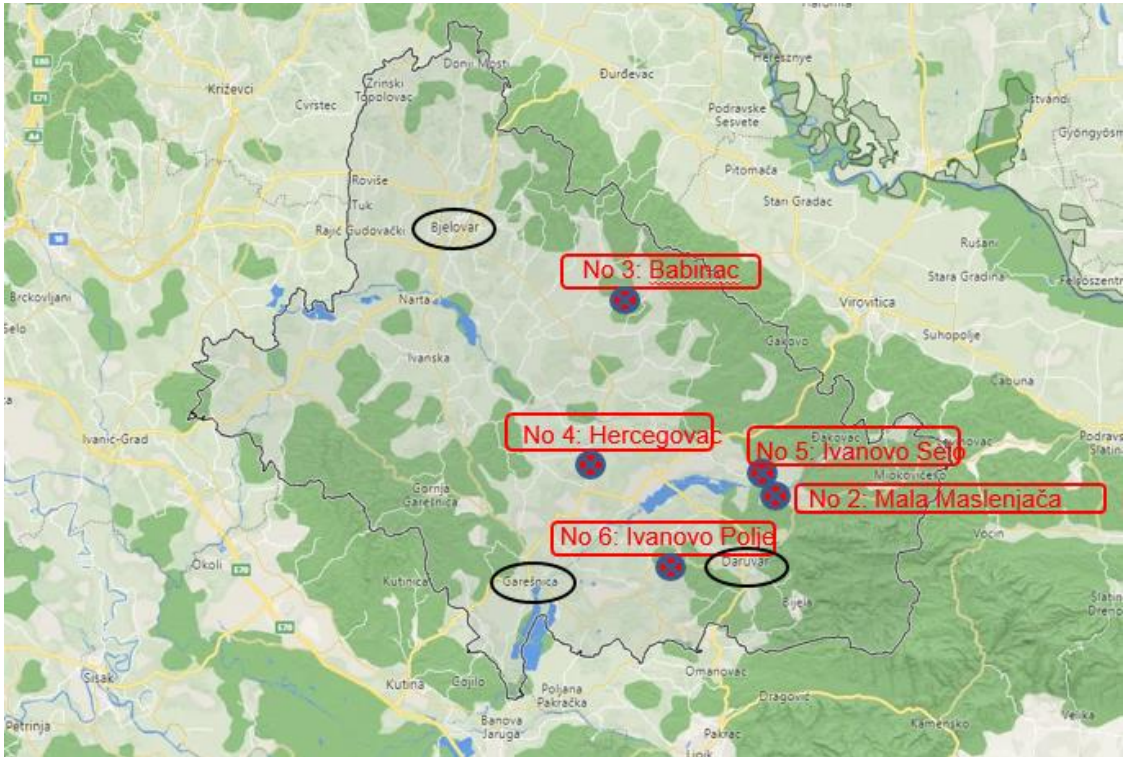
Patient 4 (2022): female, 58 y.

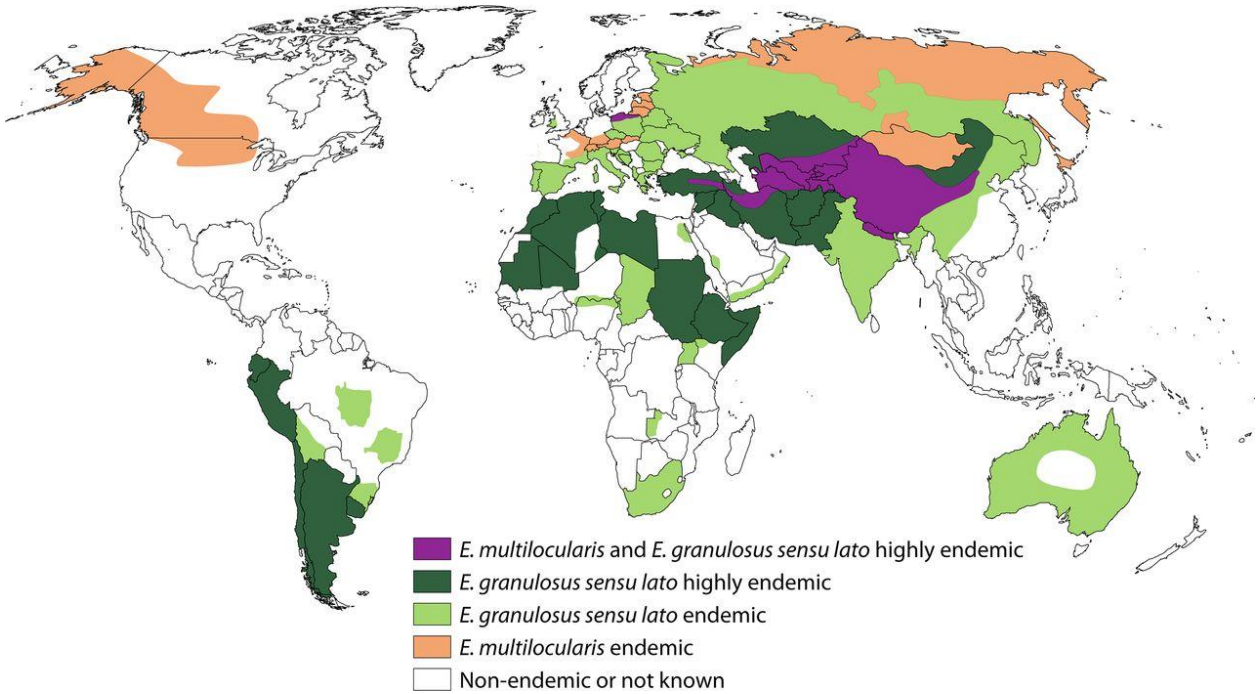






Distributon of human cases in Bjelovarsko – Bilogorska County





E. multilocularis and *E. granulosus sensu lato* highly endemic
E. granulosus sensu lato highly endemic
E. granulosus sensu lato endemic
E. multilocularis endemic

First report of *Echinococcus multilocularis* in cats in Poland: a monitoring study in cats and dogs from a rural area and animal shelter in a highly endemic region

Jacek Karamon*, Jacek Sroka, Joanna Dąbrowska, Ewa Bilska-Zając, Jolanta Zdybel, Maciej Kochanowski, Mirosław Różycki and Tomasz Cencek

Abstract

Background: Alveolar echinococcosis is a dangerous zoonotic disease caused by larval forms of *Echinococcus multilocularis*. In its life-cycle, the principal definitive host is the red fox; however, domesticated carnivorous animals (dogs and cats) can also act as definitive hosts. Until now, there were no data concerning this infection in cats in Poland. The aim of this study was to estimate the prevalence of *E. multilocularis* in cats and dogs originating from rural areas and animal shelters in a region characterised by a high prevalence of *E. multilocularis* in red foxes.

Methods: Samples of faeces were collected from 67 cats and 268 dogs from a rural area (villages and animal shelters) of a highly endemic region in southeastern Poland. Samples were examined using nested PCR (*E. multilocularis*), multiplex PCR (*E. multilocularis*, *Taenia* spp.) and PCR [*E. granulosus* (*s.l.*)]. Additionally, faeces were examined microscopically (flotation). Moreover, intestines from 110 red foxes shot in the investigated area were examined (sedimentation and counting technique).

Results: Positive PCR results for *E. multilocularis* were obtained in 4 cats (6.0%) and 4 dogs (1.5%). There were no significant differences between groups of animals (from a shelter and with an owner) concerning the prevalence of *E. multilocularis* in both cats and dogs. *Taenia* spp. were found in 10 cats (14.9%) (*Taenia taeniaeformis* and *T. hydatigena*) and 26 dogs (9.7%) (*T. hydatigena*, *T. serialis*, *T. taeniaeformis*, *T. crassiceps*, *T. pisiformis* and *T. ovis*) and *Mesocestoides litteratus* was found in 4 cats (6.0%) and 3 dogs (1.1%). All samples were negative for *E. granulosus* by PCR. Taking into consideration PCR and flotation results, 29 cats (43.3%) and 73 dogs (27.2%) were infected with helminths (26.9 and 11.9%, respectively, were infected with tapeworms). The highly endemic status of the investigated area was confirmed by examination of red foxes: 48.2% of examined red foxes were infected with *E. multilocularis*.

Conclusions: To the best of our knowledge, this study reports the presence of *E. multilocularis* in cats for the first time in Poland and confirms the role of dogs in this infection in highly endemic areas.

Keywords: Cat, Dog, *Echinococcus multilocularis*, Helminths, Hookworms, *Mesocestoides*, *Taenia*, *Toxocara*, Poland

1 human case

2025
1 human case

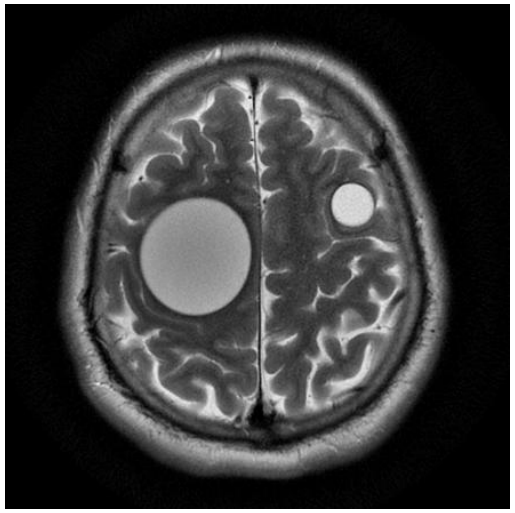
Differences in Cysts

Echinococcus granulosus

- Slow development of cyst
- Cysts have thick-walled chambers
- Separated by connective tissue
- Cyst is fluid filled
- Cyst is free of host material

Echinococcus multiloculoris

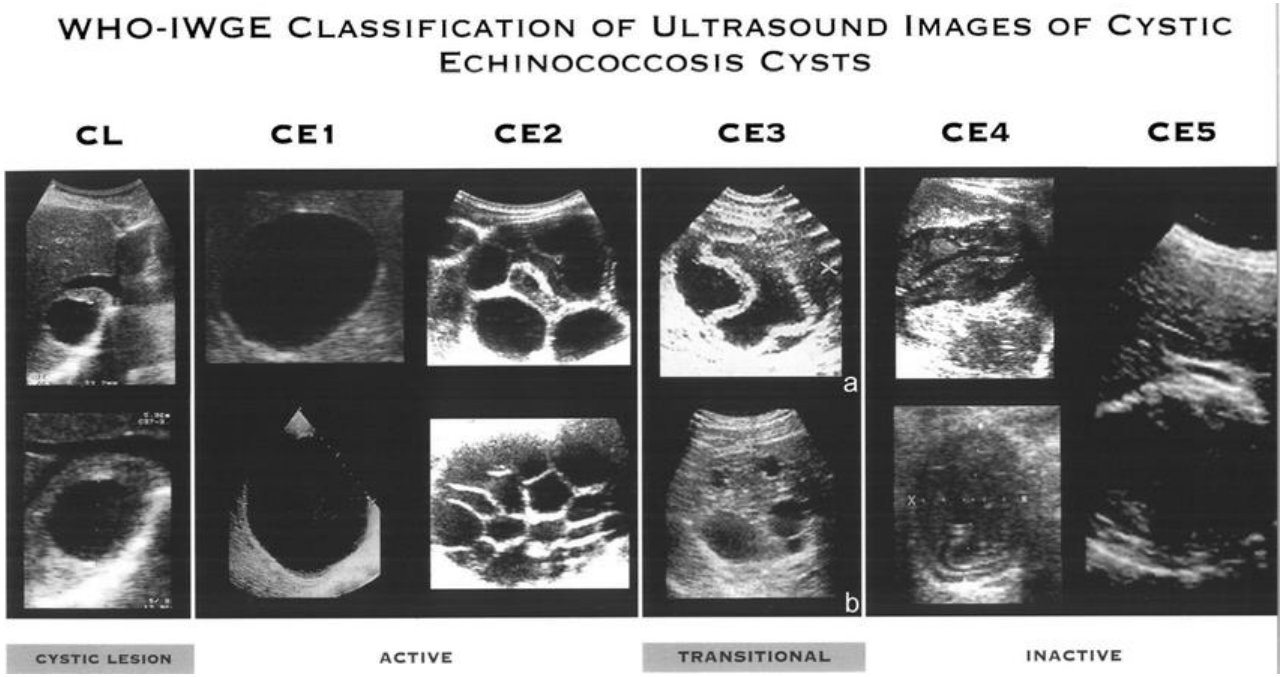
- Rapid development of cyst
- Cyst has thin-walled chambers
- Not separated by connective tissue
- Cyst is gelatinous filled
- Cyst is contaminated by host material



Diagnosis - general

- Imaging techniques essential for diagnosis and follow up
- Relatively inexpensive and portable ultrasound (US) widely used to diagnose CE and AE liver lesions
- X rays, CT, MR for other cysts
- Serology – confirmatory step – various levels of sensitivity/specificity – involved species, lesion location, antigen used
- US-mass population screning – diagnosis of asymptomatic cases
- Systemic folow up of patients with different conditions – increase of asymptomatic cases to

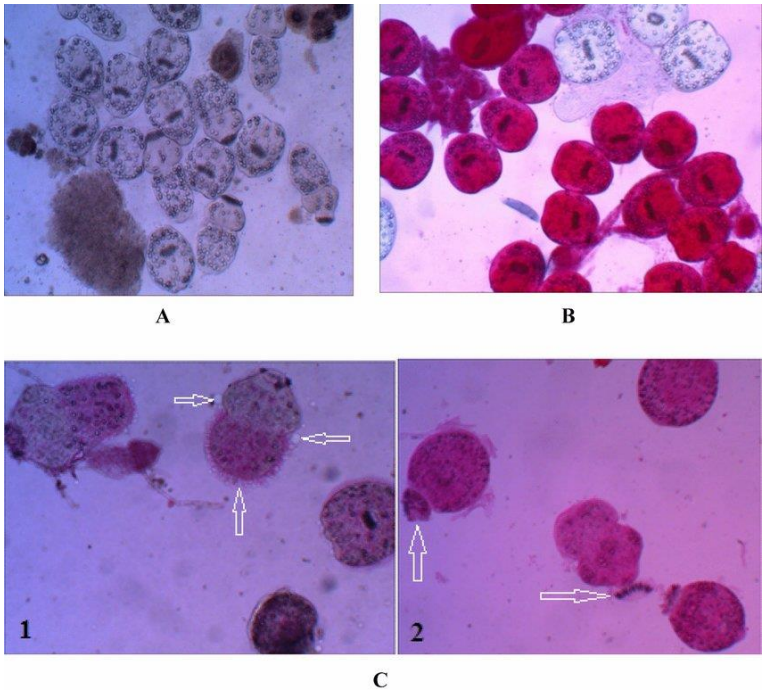
Diagnosis - general



Diagnosis - general

P	Primary lesion localized to the liver
PX	Primary lesion cannot be assessed
P0	No detectable hepatic lesion
P1	Peripheral hepatic lesion with no proximal hepatic vascular or biliary involvement
P2	Central hepatic lesion with proximal involvement of vessels or biliary ducts in 1 lobe
P3	Central hepatic lesion with involvement of hilar vessels or biliary ducts in both lobes or with involvement of 2 hepatic veins
P4	Hepatic lesion with extension along the vessels and biliary tree
N	Extrahepatic involvement of neighboring organs or tissues (diaphragm, lung, pleura, pericardium, heart, gastric or duodenal wall, adrenal gland, peritoneum, retroperitoneum, parietal wall [muscles, skin, bone], pancreas, regional lymph nodes, hepatic ligaments, kidney)
NX	Cannot be evaluated
NO	No regional involvement
N1	Regional involvement of contiguous organs or tissues
M	Absence or presence of distant metastasis (in lung, distant lymph nodes, spleen, central nervous system, orbits, bone, skin, muscle, kidney, distant peritoneum, and retroperitoneum)
MX	Not completely evaluated
M0	No metastasis
M1	Metastasis

Diagnosis



- Images of living, dead, and partially dead E. granulosus protoscolices following staining with 0.1 percent eosin

Casoni skin test

- The test is positive in about 90% of cases of hydatid disease affecting the liver, but positive in less than 50% of patients with hydatid disease elsewhere in the body; false positive results are also common

Diagnosis- antibody detection

- AE and CE are lacking pathognomonic clinical signs, imaging technologies and serology remain the main pillars for diagnosis
- Methods: IHA, IFA, EIA, CF, La, imunoelectrophoresis, immunoblotting
- Response – location and viability of cysts/lesions
- Calcified, senescent or dead cysts – often negative serologic results
- Liver cysts – greater serological response 90%, lung cysts 50%, brain or spleen less than 50%
- Cross reactions – in low titres in patients with other parasitic diseases, liver cirrhosis and collagen disease

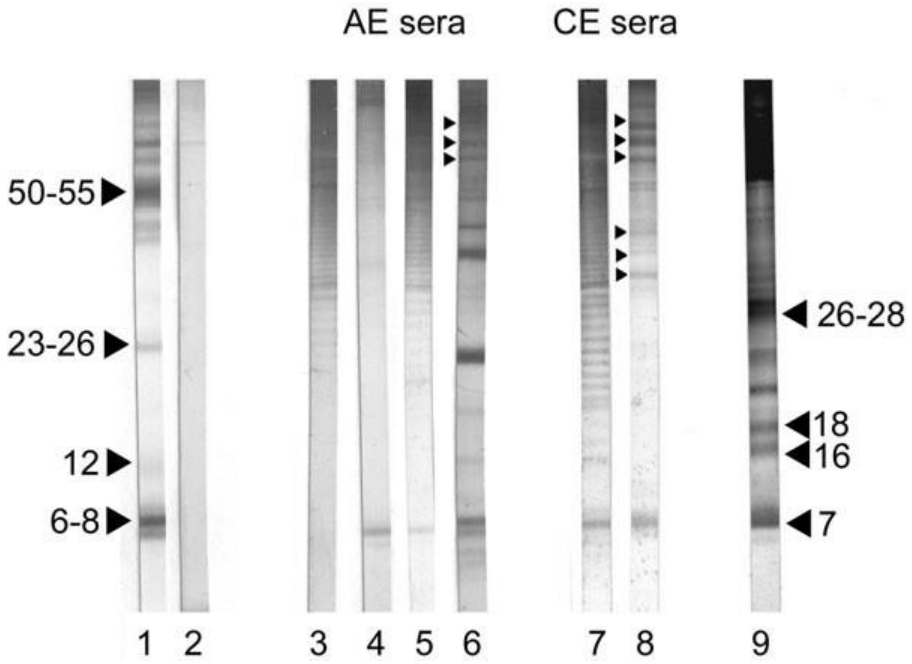
Diagnosis- serology

- Hidatid fluid (HF) major antigenic source for immunodiagnosis
- Test with recombinant antigens (arc-5, 8 kDa antigen) increased sensitivity
- Test positivity in screening test – immunobloting
- Immunobloting – monitor therapy, EIA and IHA positive results for years
- AE patients usually serologicaly positive when *E. granulosus* antigens are used

Diagnosis- serology

- Em2, Em2G11, Em18
- Sensitivity more than 95%
- Specificity 99%

Diagnosis- serology



DNA detection

- Recently developed DNA based methods – quantitative and/or nested PCR assays
- Highly sensitive
- Reasonably specific able to distinquish species
- Determine genotypes
- Routinely used on biopsy specimens in unusual imaging aspects and/or in patients with negative serology
- Detection of eggs in contaminated areas

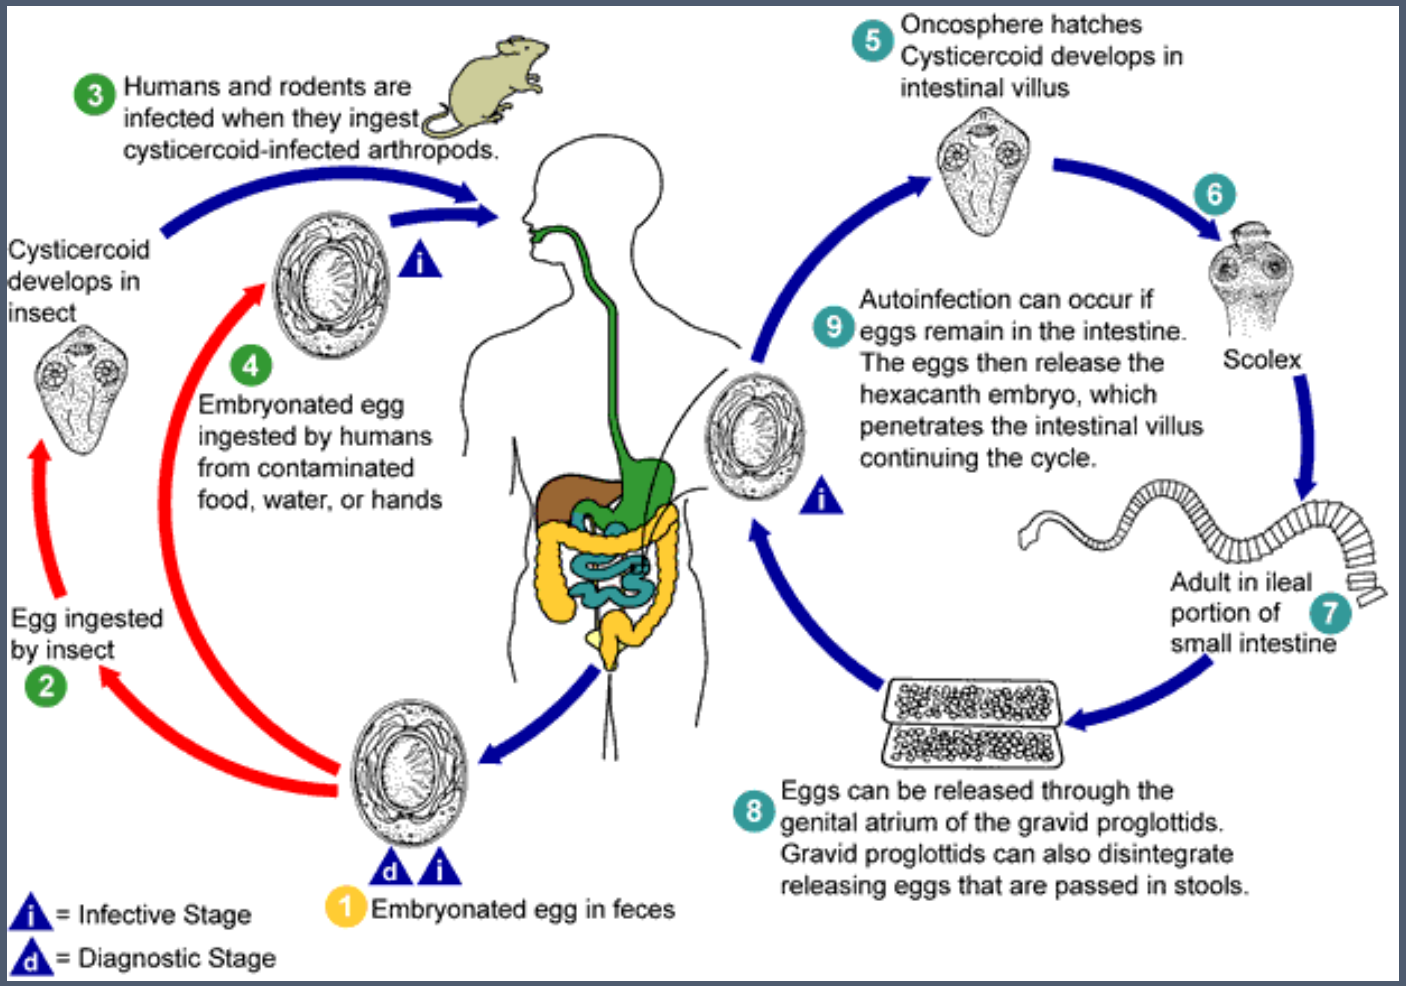
Conclusion

- From 2017 the number of cases of autochtoneous human AE in Croatia is rising

- US screening of persons from endemic regions?
- Serolgy in persons from endemic regions with tumorous hepatal lesions
- Education of physicians (internal medicine, surgeons, oncologist, radiologist)
- Reporting!!!

Hymenolepis (Vampirolepis) nana

- Patuljasta trakavica
- Veličina 1 – 4 cm
- Rasprostranjena širom svijeta
- Konačni domaćin glodavci i čovjek
- Prijelazni buhe (alternativno)



3 Humans and rodents are infected when they ingest cysticercoid-infected arthropods.
Cysticercoid develops in insect
4 Embryonated egg ingested by humans from contaminated food, water, or hands
Egg ingested by insect
2
1 Embryonated egg in feces
i = Infective Stage
d = Diagnostic Stage
5 Oncosphere hatches Cysticercoid develops in intestinal villus
6
Scolex
9 Autoinfection can occur if eggs remain in the intestine. The eggs then release the hexacanth embryo, which penetrates the intestinal villus continuing the cycle.
Adult in ileal portion of small intestine
7
8 Eggs can be released through the genital atrium of the gravid proglottids. Gravid proglottids can also disintegrate releasing eggs that are passed in stools.

Hymenolepis nana

Klinička slika

- Najčešće asimptomatska
- Simptomatska – nespecifični (glavobolje, vrtoglavice, proljevi, inapetenca)

Hymenolepis nana

Laboratorijska dijagnostika

- Uzorak stolica
- Nalaz velikih, prozirnih, karakterističnih jaja (polarni filamenti)

Laboratorijska dijagnostika valjkastih crva

Koljeno Nematoda

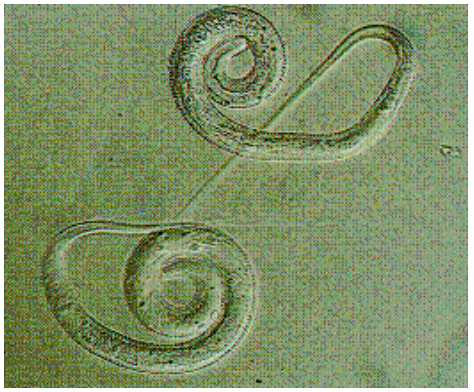
- Nesegmentirani beskralješnjaci valjkaste, crvolike građe
- Veličina: manje od mm – 1 m

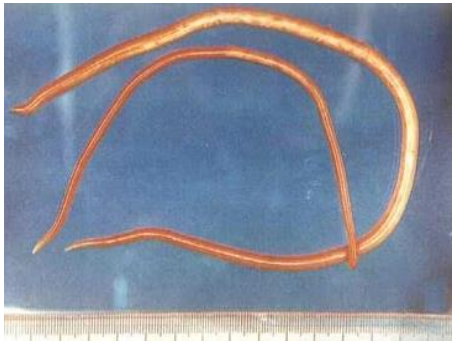
  (mužjaci obično manji od ženki)
- Odvojeni spolovi
- Kompleksni tegument i probavni sustav

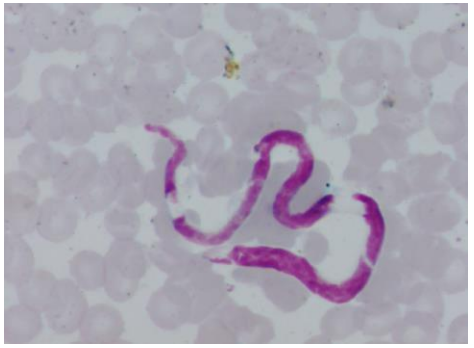
Nematode

crijevne

krvno - tkivne







Medicinski značajne nematode

- Enterobius vermicularis
- Ascaris lumbricoides
- Toxocara canis
- Toxocara cati
- Trichuris trichiura
- Ancylostoma duodenale
- Necator americanus
- Ankylostoma braziliense
- Strongyloides stercoralis
- Trichinella spiralis
- Wuchereria bancrofti
- Brugia malayi
- Loa loa
- Mansonella spp.
- Onchocerca volvulus
- Dirofilaria immitis
- Dracunculus medinensis

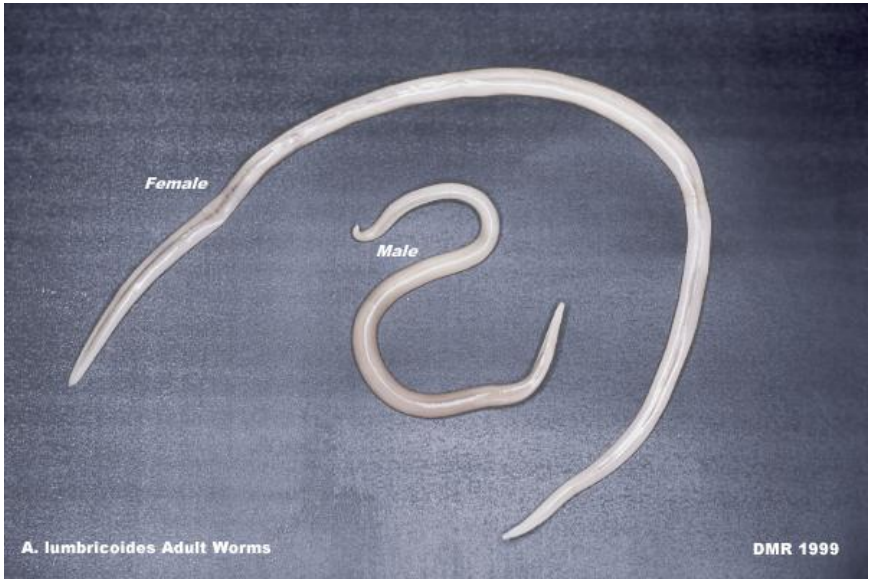
- Ascaris lumbricoides
- Trichuris trichiura
- Ancylostoma duodenale
- Strongyloides stercoralis
- Enterobius vermicularis
- Trichinella spiralis
- Filarije

Ascaris lumbricoides

- Velika dječja glista
- Uzročnik askarioze
- Rasprostranjen širom svijeta
- WHO – 2018. god. – 1,4 milijarda inficiranih

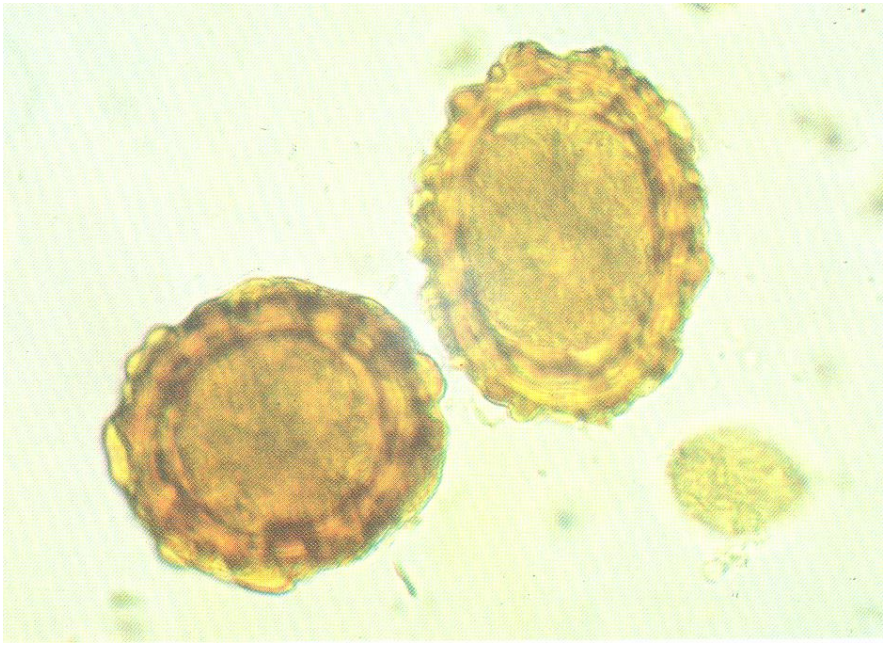
Ascaris lumbricoides

- Adulti žive u tankom crijevu
- Veličina:
  mužjaci 15-20 cm x 3-4 mm, ženke 20-30 cm x 5-6 mm

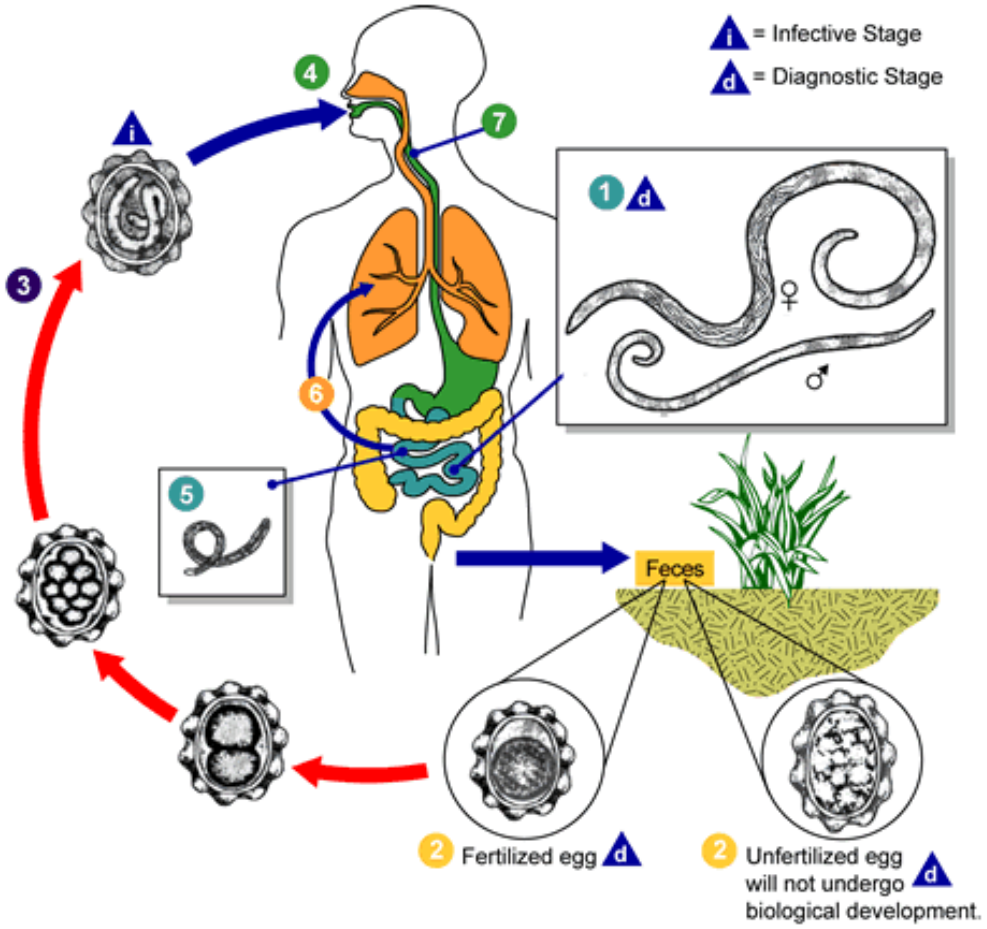


Ascaris lumbricoides

- Ženka polaže oko 200 000 jaja na dan
- Jaja neembrionirana
- Veličine 60x45 µm, debela, smeđa ljuska, najčešće čvoraste površine



Ascaris lumbricoides



Ascaris lumbricoides

Epidemiologija

- Humani parazit
- Jaja vijabilna nekoliko godina u vlažnom tlu
- Infekcija zagađenom hranom, tlom (geofagija), vodom
- Prevalencija najveća u djece

Ascaris lumbricoides

Klinička slika

- Infekcija često asimptomatska
- U težim slučajevima bolesti **migracija ličinki** može dovesti do pneumonitisa

  Löfflerov sindrom – kašalj, dispneja, febrilitet, eozinofilija

Ascaris lumbricoides

Intestinalna faza

- Osjećaj težine u trbuhu, povraćanje, proljevi
- Adult može migrirati u žučne vodove, jetru, peritoneum
- Opstrukcija crijeva, perforacija, apendicitis

Ascaris lumbricoides

Laboratorijska dijagnostika

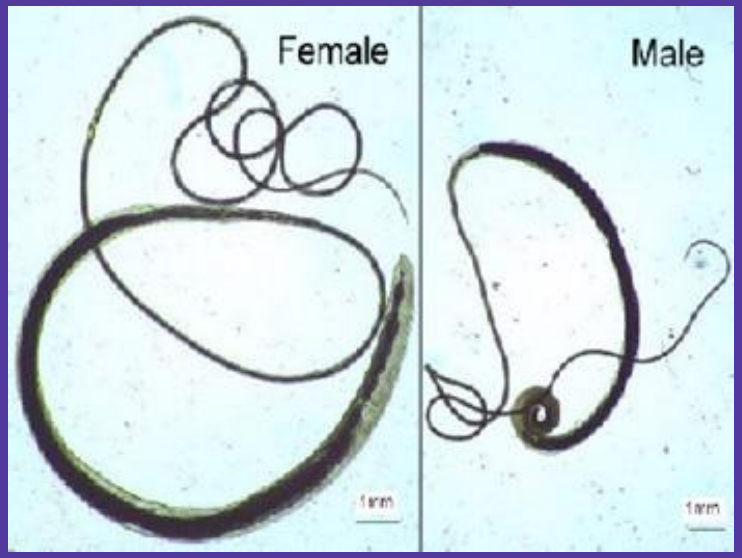
- Uzorak: stolica, sputum, krv
- Stolica: nativni preparat, MIFC - jajašca
- Sputum: nalaz ličinki
- Serologija: EIA

Trichuris trichiura

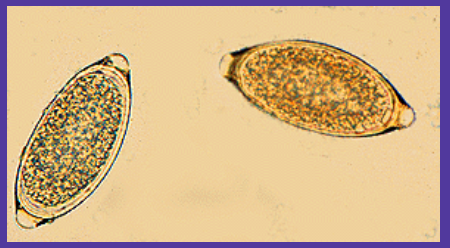
- Crv vlašnjak
- Uzročnik trihurioze
- Parazit primata (ljudi i majmuni)
- Rasprostranjen širom svijeta
- WHO 2018.god.- inficirana 1 milijarda ljudi

Trichuris trichiura

- Živi u ileocekalnom području i u debelom crijevu
- Ružičasto crvene boje
- Mužjak 3-4 cm, ženka 3,5-5 cm
- Prednji dio tanak, zadak zadebljan, u mužjaka spiralno savijen

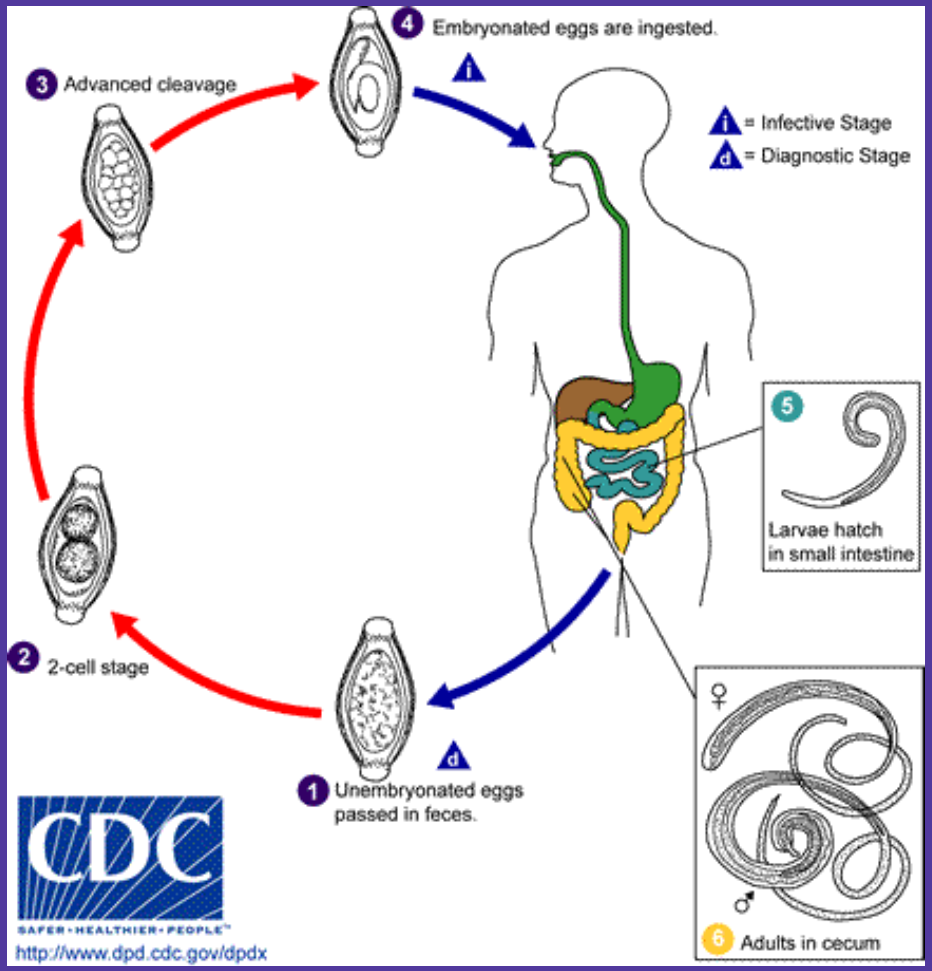


Trichuris trichiura



- Ženka leže 2 000-14 000 jajašca dnevno
- Jajašce u obliku bačvice ili limuna
- Veličine 50-55 µm x 35-50 µm
- Vanjska ljuska smeđe obojena,
  tri unutarnja sloja bezbojna, hijalini polarni čepovi
- Jajašce nije segmentirano
- Kisik nužan za sazrijevanje
- U našem podneblju –10 tjedana- u jajašcu invazivna ličinka
- Otporno, u vlažnoj sredini vijabilno nekoliko godina

Trichuris trichiura



Trichuris trichiura

Klinička slika

- Ovisna o broju parazita
- Mali broj parazita - nema simptoma
- Veliki broj, mala djeca – bolovi u trbuhu, krvavi proljevi, gubitak apetita, mršavljenje, apendicitis, anemija

Trichuris trichiura

Laboratorijska dijagnostika

- Uzorak: stolica
- Nativni preparat, MIFC - nalaz karakterističnih jajašaca

Enterobius vermicularis (Oxyuris vermicularis)

- Mala dječja glista
- Uzročnik enterobioze, oksiuroze
- Rasprostranjen po čitavom svijetu
- WHO – 2018.god.- 500 mil. ljudi inficirano

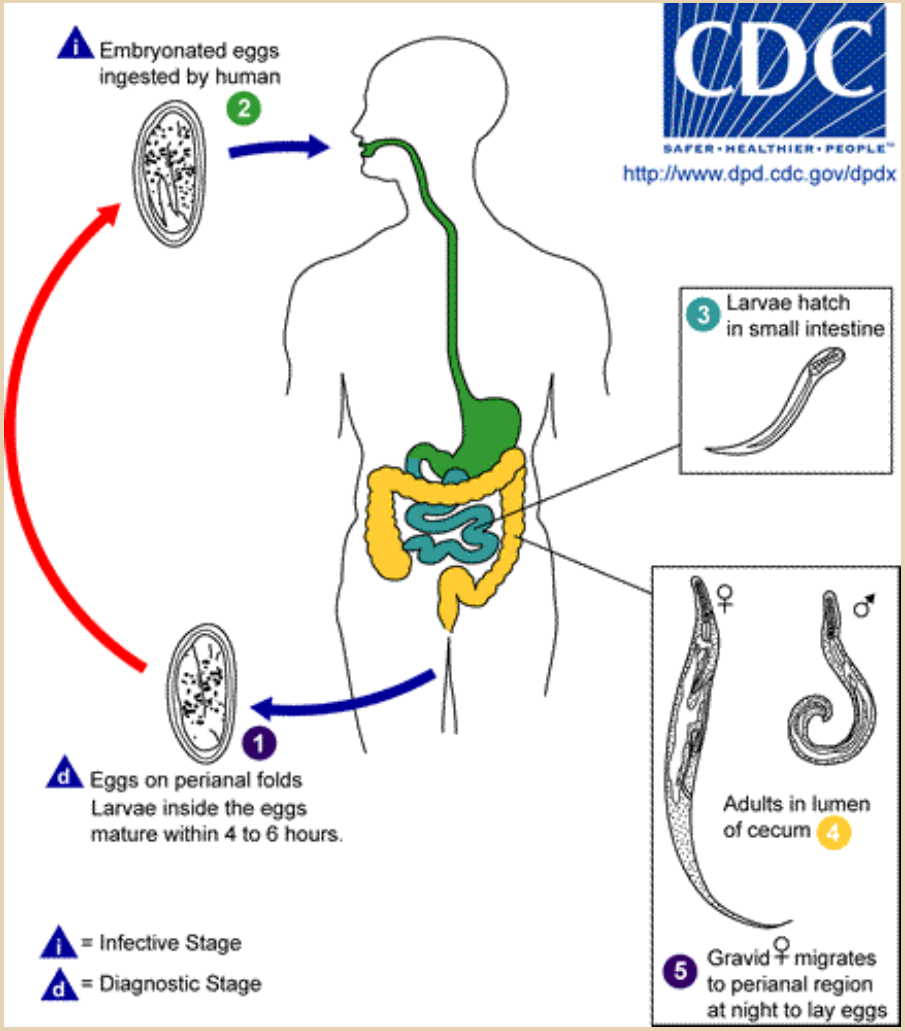
Enterobius vermicularis

- Makroskopski podsjeća na komadiće konca
- Bijele boje
- Mužjak 2-5 mm, tanak, vitak, zavijen ventralno
- Ženka 8-13 mm, vitka, ispruženog tijela
- Oboljeva samo čovjek

Enterobius vermicularis

- Adulti žive na sluznici debelog crijeva, rjeđe krajnih dijelova tankog crijeva
- Ženka tijekom noći polaže jaja (10 000) u području perianalne regije

Enterobius vermicularis



Enterobius vermicularis

Jajašca

- Nesimetrično ovalna, veličine 50-60 x 20-30 μm
- Glatke i prozirne ljuske
- Sadrže embrio koji se za 4-6 sati razvije u infektivnu ličinku
- Vijabilna 4 tjedna u vlažnoj sredini
- Autoinfekcija!

Enterobius vermicularis

Klinička slika

- Većina infekcija asimptomatska
- Simptomatska bolest – perianalni svrbež, nesanica, mršavljenje, sekundarna bakterijska infekcija, genitourinarni problemi i granulomi (migracija parazita u vaginu)
- U rijetkim slučajevima penetracija u peritonealnu šupljinu, jetru, pluća

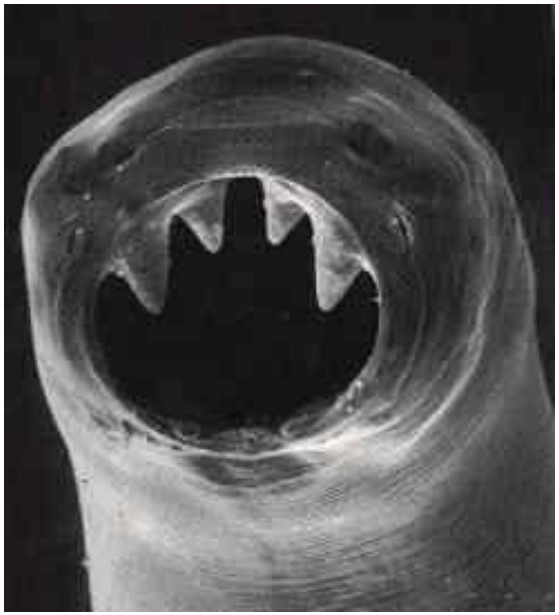
Enterobius vermicularis

Laboratorijska dijagnostika

- Ponekad nalaz jajašca i živih crva u stolici
- Metoda izbora: perianalni otisak ljepljivom trakom

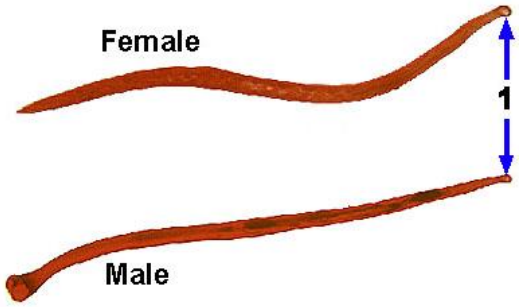
Ancylostoma duodenale

- Rudarska glista
- WHO 2018.god. – 900 milijuna ljudi inficirano
- Uz malariju najozbiljniji medicinsko - socijalni problem tropskih i subtropskih zemalja
- Ankilostomoza – Ebersov papirus (1600 g.p.n.e)



Ancylostoma duodenale

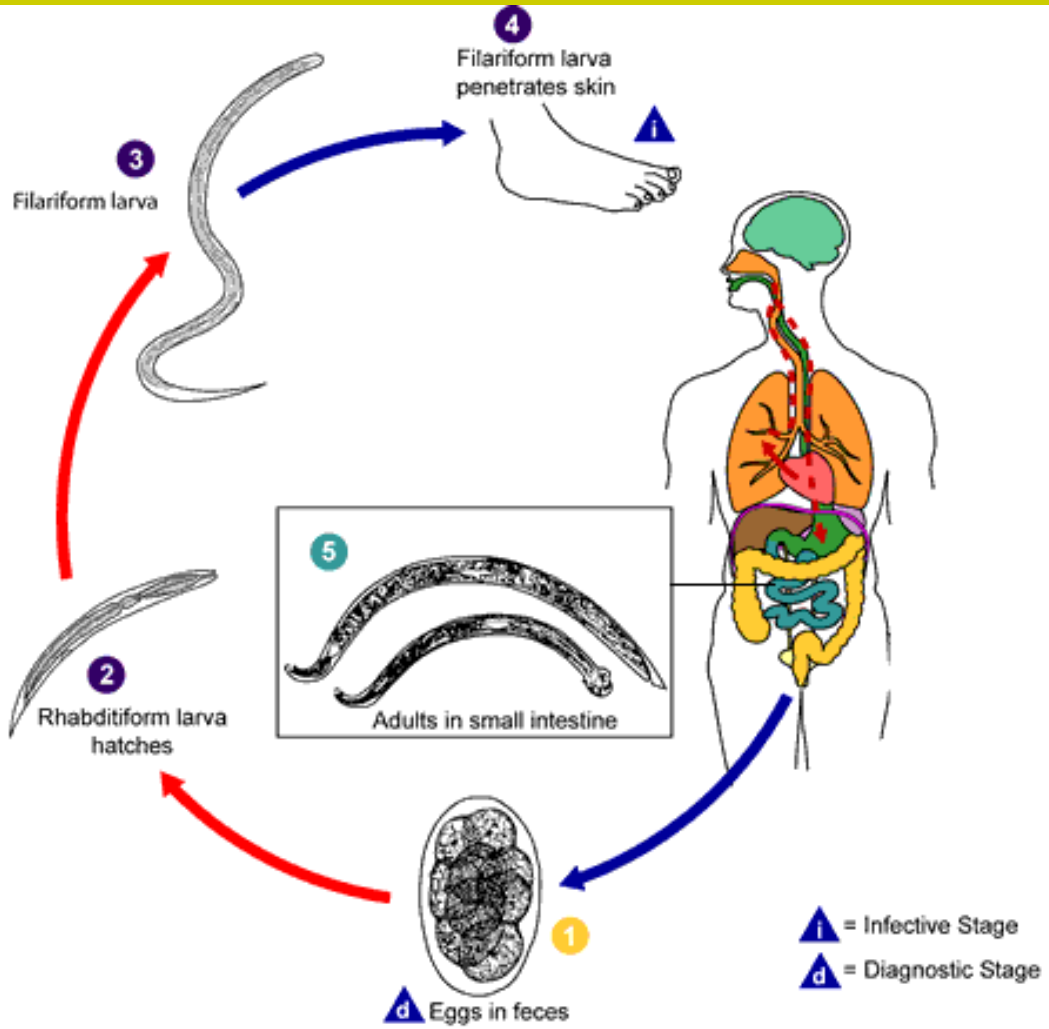
- Parazit duodenuma i gornjeg dijela tankog crijeva
- Adult: mužjaci 8-11 mm, ženke 10-13 mm
- Sivkaste boje
- Razjapljen usni otvor (krivousta glista)
- U usnom otvoru čvrste kukice za prihvaćanje uz sluznicu tankog crijeva
- Mužjak - karakteristično građen kopulacijski aparat u obliku krilca



Ancylostoma duodenale

- Oplođene ženke nesu jajašca (- 20 000 na dan)
- Jajašca – 60x40 µm, tanka prozirna ljuska, 4 zametne stanice
- Vlažna i topla zemlja – rabditoidne ličinke – filariformne ličinke (infektivne)

Ancylostoma duodenale



Ancylostoma duodenale

Klinička slika

- Penetracija ličinki kroz kožu – alergijska reakcija i osip
- Migracija – pneumonitis
- Adulti mučnina, povraćanje, proljev, mršavljenje, hipokromna anemija, edemi (hipoproteinski)

Ancylostoma duodenale

Laboratorijska dijagnostika

- Uzorak: stolica
- Nalaz jajašca (nativni preparat, MIFC)
- Koprokultura
- Serologija – nije rutinska

Strongyloides stercoralis

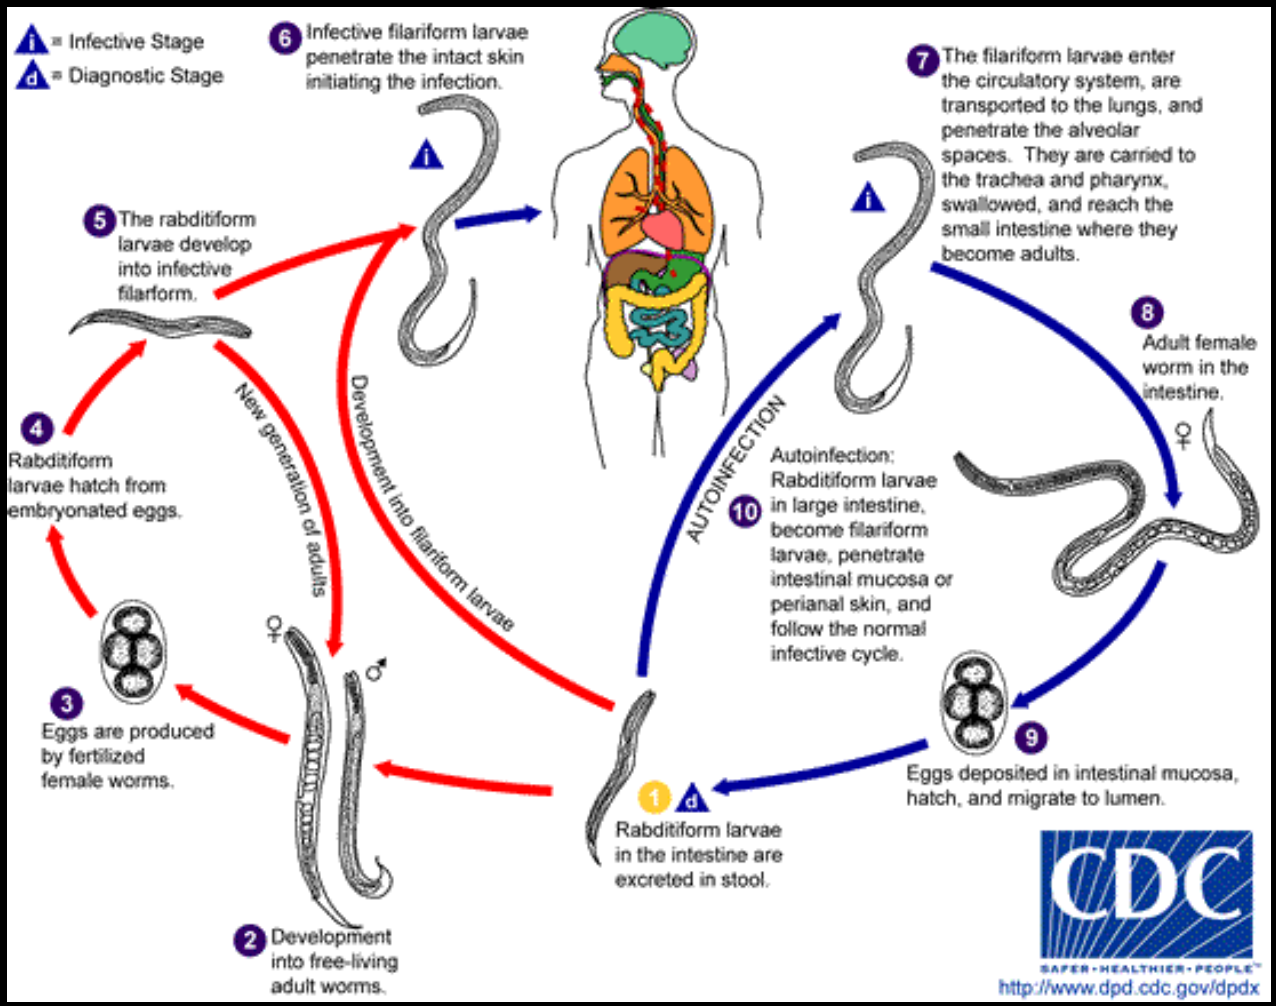
- Uzročnik strongiloidoze
- Parazit čovjeka, majmuna i pasa
- Infekcija najčešće u vlažnim, toplim krajevima, rjeđe u umjerenoj klimatskoj zoni
- WHO – 2018. 100 mil. inficiranih
- Opisan 1876.u stolici i sluznici tankog crijeva od proljeva umrlih francuskih vojnika u Indoneziji

Strongyloides stercoralis

Morfologija i biologija

- U pravilu ima jednu slobodnu i jednu parazitsku generaciju
- Ženke veličine 1 mm, mužjaci 0,7 mm

Strongyloides stercoralis



Strongyloides stercoralis

Klinička slika

- Kožne lezije – jak svrbež, crvenilo kože
- Pluća – pneumonitis (eozinofilija)
- Tanko crijevo – bez simptoma
- Simptomi : povraćanje, proljev, bolovi, malapsorpcija

Strongyloides stercoralis

- Sistemska infekcija – kod imunosuprimiranih pacijenata (AIDS, bolesnici s malignim bolestima, na kortikosteroidnoj terapiji, transplantirani)
- Diseminacija ličinki u virtualno svaki organ (pluća, jetra, slezena, bubreg, pankreas, srce, mozak)
- Mortalitet 90 %

Strongyloides stercoralis

Laboratorijska dijagnostika

- Uzorak: stolica, duodenalni aspirat, sputum
- Stolica: nativni preparat, MIFC, koprokultura
- Nalaz ličinki rabditoidnog tipa
- Jajašca se ne traže
- Obraditi najmanje 3 uzorka stolice
- Serologija: EIA

Trichinella

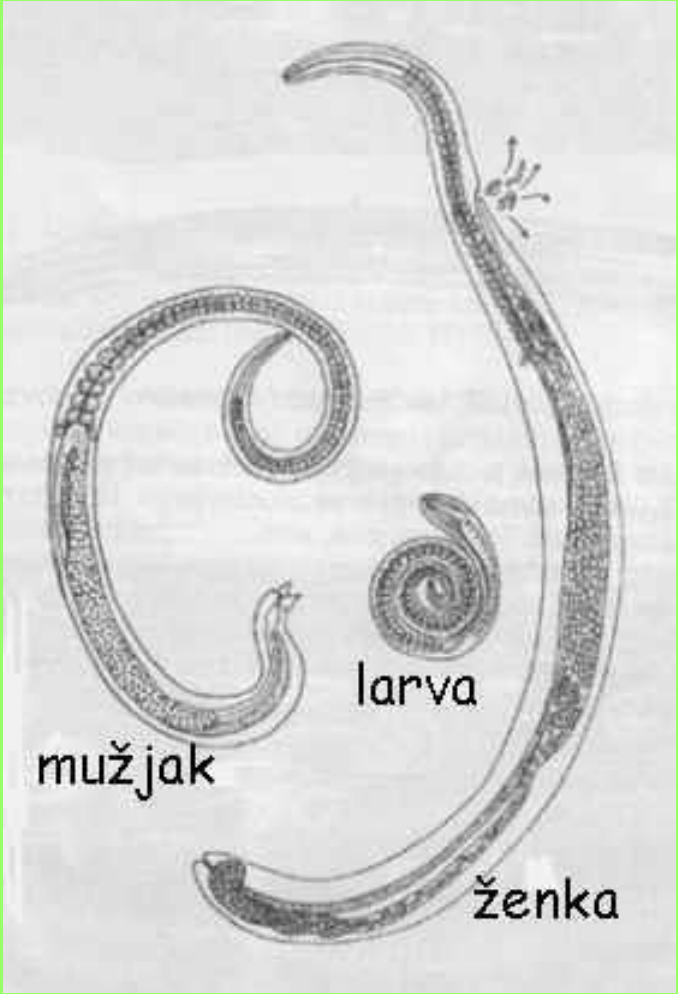
- Uzročnik trihineloze
- Poznato više vrsta
- **T. spiralis**
- T. britovi
- T. murelli
- T. nativa
- T. nelsoni
- T. pseudospiralis
- T. papuae
- T. zimbabwensis

Trichinella spiralis

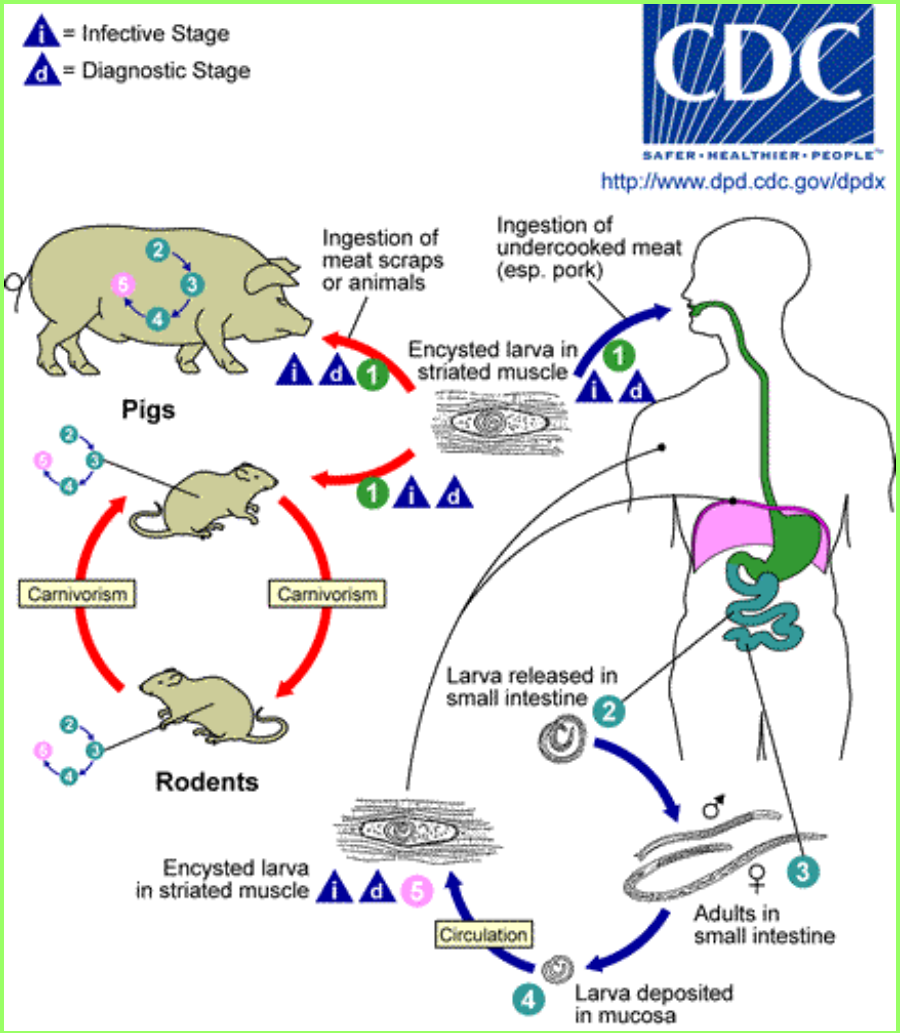
- Kod nas najznačajnija T. spiralis
- Prvi put ju je opisao, ne znajući o čemu je riječ student medicine tijekom anatomske sekcije kadavera početkom 19. stoljeća
- 1835. godine James Paget i Richard Owen – opisuju novu nematodu
- 1860. godine njemački patolog Rudolph Virchow opisao je životni ciklus parazita.

Trichinella spiralis

- Parazit mesoždera i sveždera (divljih i domaćih životinja, čovjeka)
- Odrasli paraziti kratkotrajni su stanovnici tankog crijeva
- Tanki poput konca, mužjaci veličine 1-2, ženke 2-4 mm



Trichinella spiralis



Trichinella spiralis

Klinička slika

- Kliničke manifestacije ovise o infektivnoj dozi (50-70 ličinki T. spiralis može uzrokovati klinički manifestnu bolest u ljudi)
- T. spiralis najpatogenija
- Infekcija bifazični tijek:

  Intestinalna faza

  Ekstraintestinalna faza

Trichinella spiralis

Intestinalna faza

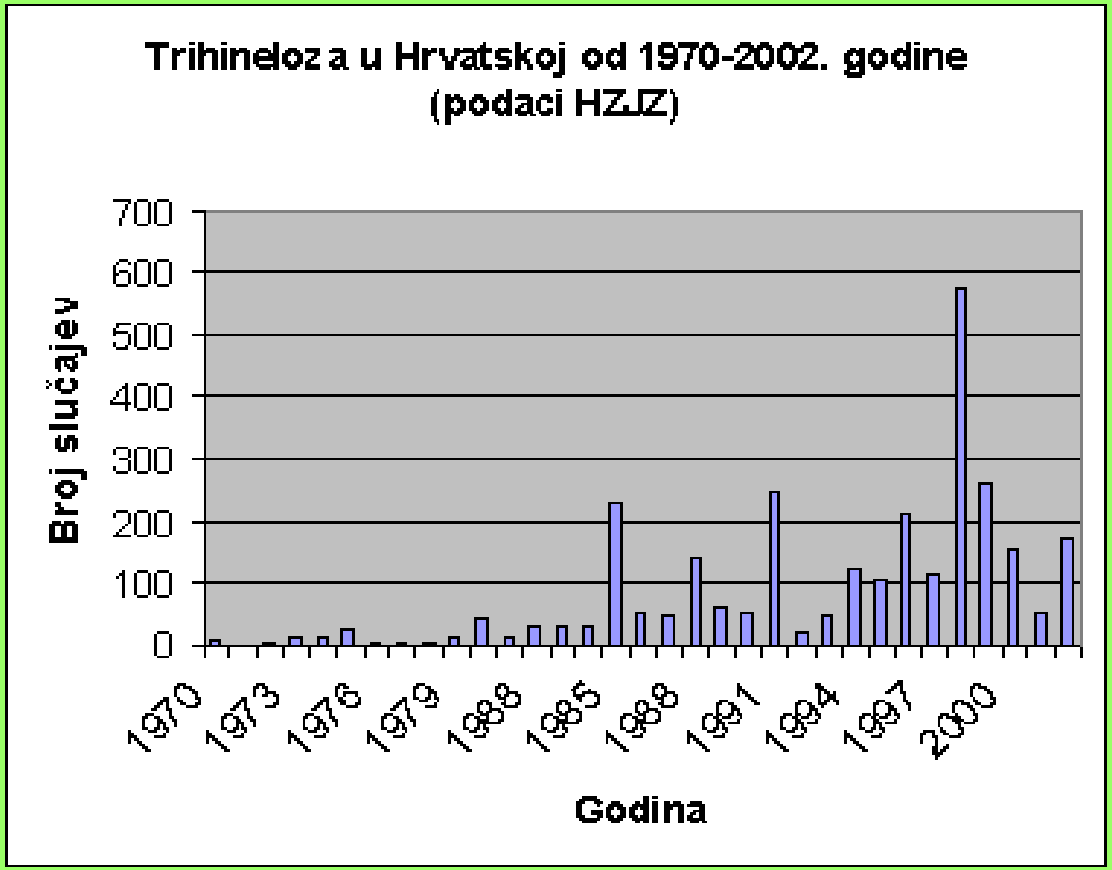
- Inkubacija 1-7 dana
- Simptomi: mučnina, povraćanje, bolovi u trbuhu, proljev, febrilitet

Trichinella spiralis

Ekstraintestinalna faza

- Inkubacija 7- dana
- Simptomi od invazije ličinki u tkivo oboljelog
- Miozitis (bolovi, ukočenost, otežano disanje i gutanje), febrilitet, edemi kapaka i lica, kožni osip
- Opasnost: miokarditis, meningoencefalitis
- Eozinofilija, povišeni LDH, CPK, kreatinurija
- Traje 1-6 tjedana

Trichinella spiralis



Trichinella spiralis

Laboratorijska dijagnostika

Direktna dijagnostika:

- Trihinela se rijetko može naći u stolici i duodenalnom soku
- Nalaz ličinki u bioptatu mišića (mikroskopski, PCR), umjetna digestija inkriminiranog mesa

Indirektna dijagnostika:

- Serologija (ELISA, ITFA, WB)

Filarije

- Nematode
- Prijenosnici – različite vrste artropoda
- Wuchereria bancrofti
- Brugia malayi
- Onchocerca volvulus
- Loa loa

Filarije

- Kompleksni životni ciklusi
- Adultne ženke legu mikrofilarije
- Artropod – razvoj do infektivnog oblika
- Paraziti limfnog sustava, potkožnog tkiva, elefantijaza, sljepoća
- Periodicitet – nokturnalni (W. Bancrofti, Brugia), diurnalni (Loa loa)
- Vermiformne, neke vrste imaju ovojnicu
- Krvni razmaz, gusta kap, serologija

Filarije

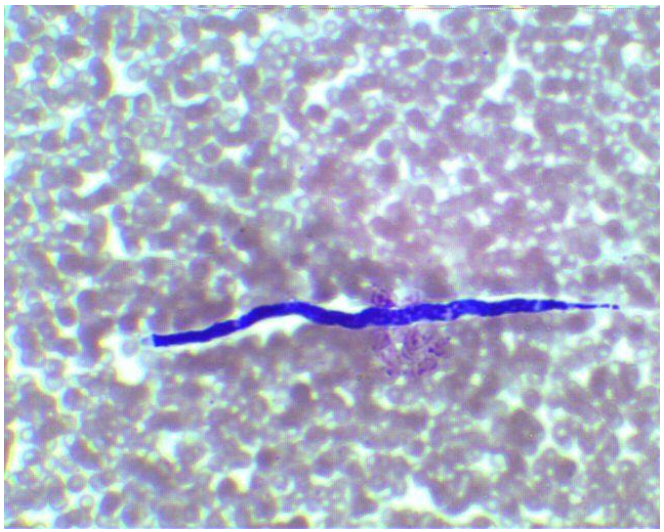
- Wuchereria bancrofti
- Adulti – limfno tkivo
- Mikrofilarija – veličina 230-320x10 mikrona, repić zašiljen nema jezgara, ima ovojnicu
- Limfangitis, limfadenopatija, elefantijaza
- Dijagnostika –periodicitet 10 pm-2am
- Krvni razmaz, gusta kap, filtracija, metode koncentracije, ELISA

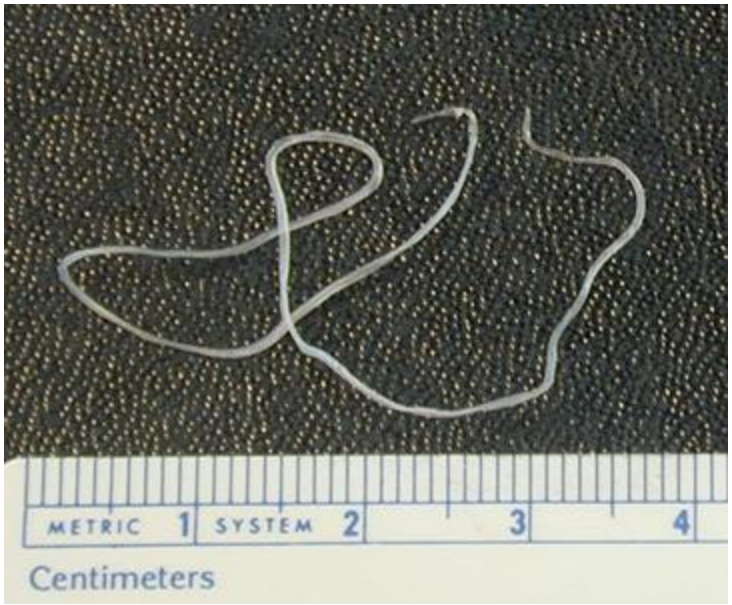
Filarije

- Brugia malayi
- Adulti limfno tkivo
- Mikrofilarija – veličina 170-260 x 5-6 mikrona, u repiću dvije jezgre, ovojnica
- Dijagnostika –periodicitet 10 pm-2am
- Krvni razmaz, gusta kap, filtracija, metode koncentracije, ELISA

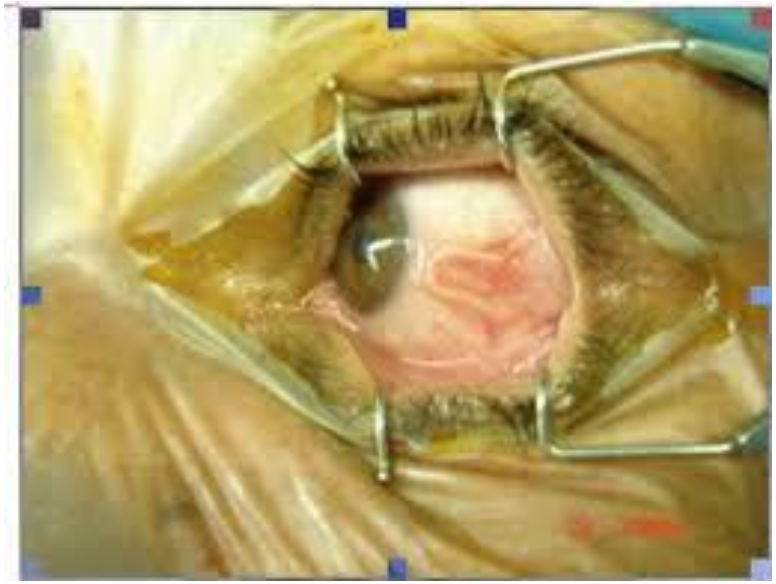
Filarije

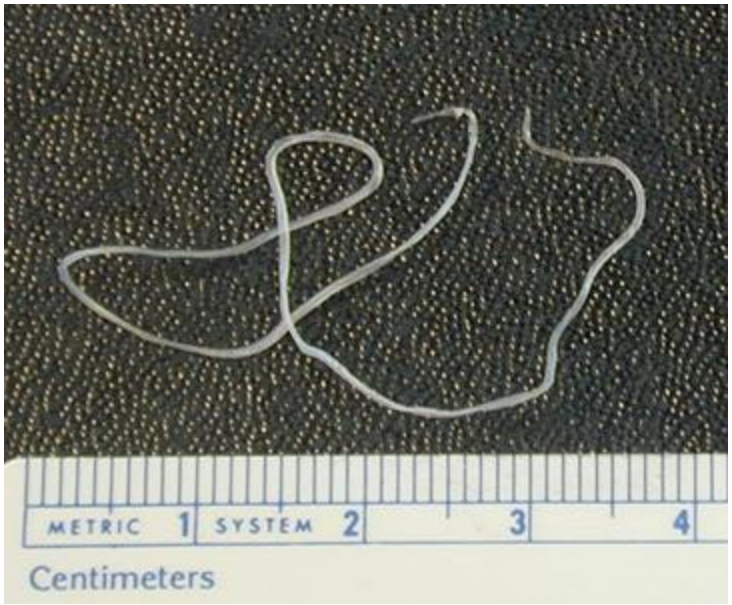
- Loa loa
- Adulti – pokožno tkivo
- Subkutani nodusi, ispod konjuktive
- Diurnalni periodicitet
- Mikrofilarija – veličina 250-300 x 6-8,5 mikrona, u repiću jezgre, ima ovojnicu
- Krvni razmaz, gusta kap, membranska filtracija, metode koncentracije, serologija



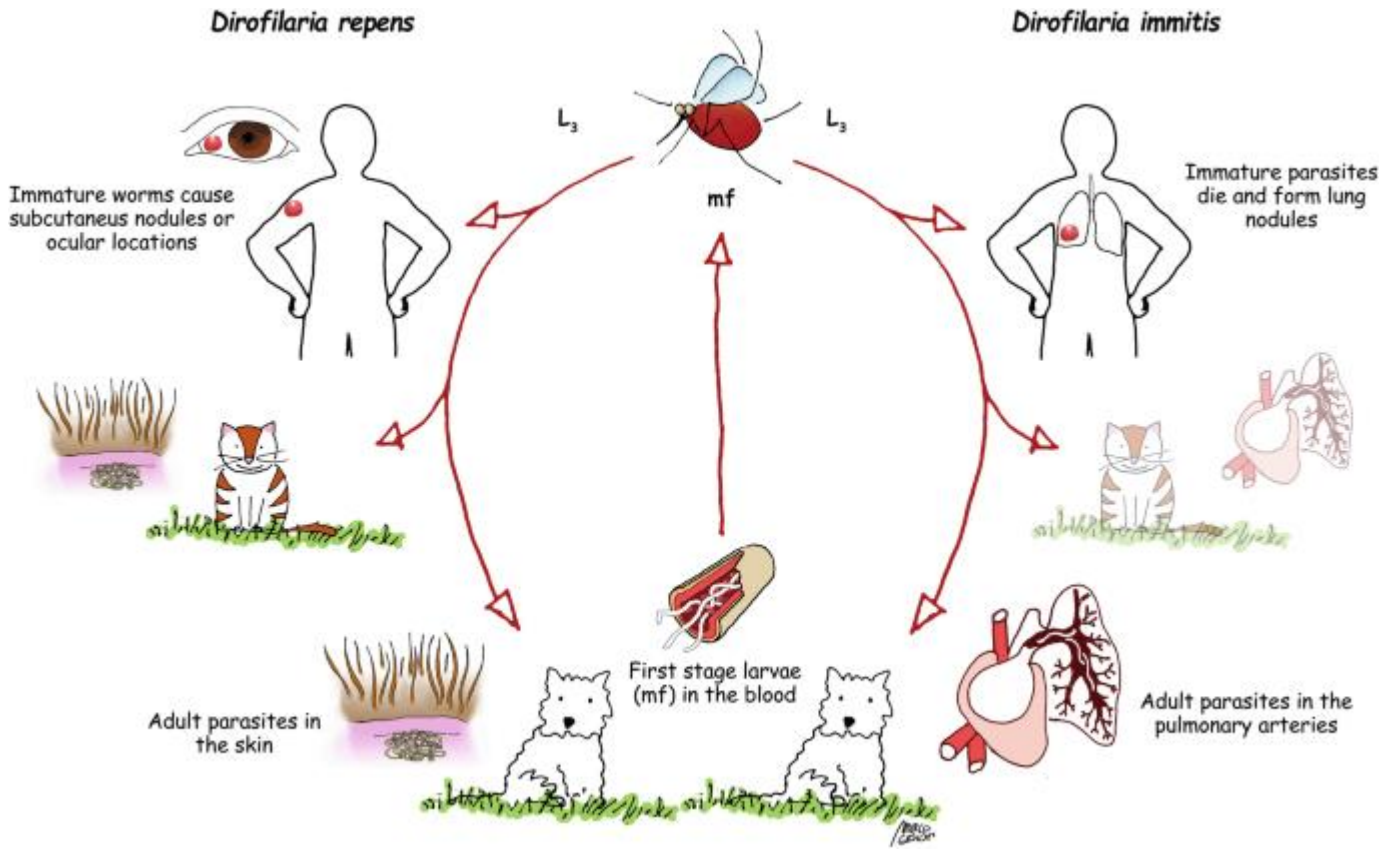


METRIC 1 SYSTEM 2 3 4
Centimeters





METRIC 1 SYSTEM 2 3 4
Centimeters

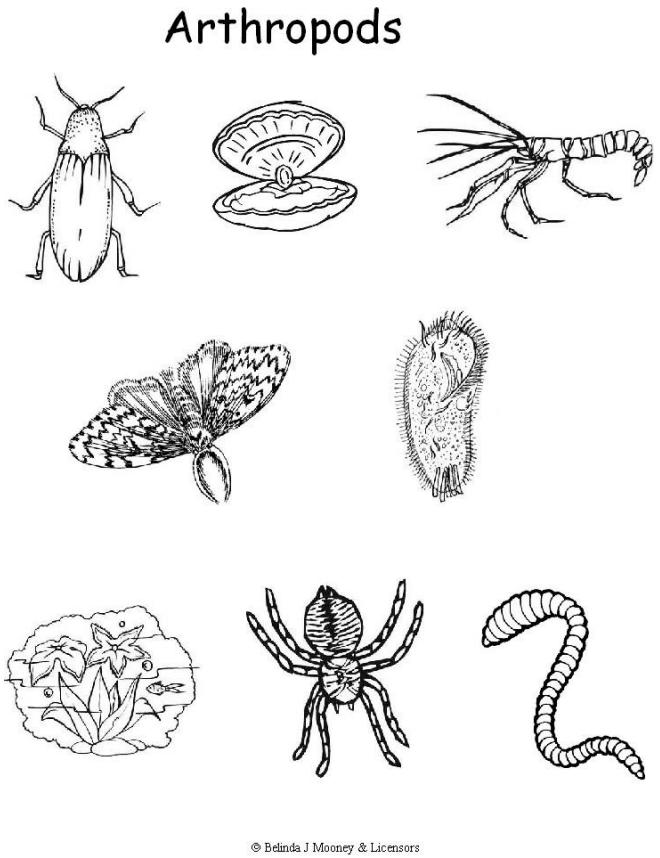


Dirofilaria repens
Dirofilaria immitis
L3
L3
mf
Immature worms cause subcutaneus nodules or ocular locations
Immature parasites die and form lung nodules
First stage larvae (mf) in the blood
Adult parasites in the skin
Adult parasites in the pulmonary arteries

Artropodi

Artropodi

- Najbogatije koljeno u životinjskom carstvu
- Izvanredno prilagođeni uvjetima okoline, napučili vode, kopno i zrak
- Mogu nanjeti veliku štetu gospodarstvu i čovjekovom zdravlju
- Medicinski značaj – često su prenosioci različitih uzročnika bolesti



Artropodi

- Višestanični organizmi
- Građa :metamerija – ponavljanje jednakih segmenata (članaka)
- Pojedini segmenti – diferencijacija i stapanje u anatomske cjeline – nastali glava, prsiše i zadak
- Na tim segmentima se nalaze lokomotorni organi – noge, krila

Artropodi

- Odvojeni spolovi
- Jaje – metamorfoza – razvojni oblici (ličinke ili larve) - adulti

Artropodi

Značaj za medicinu

- Direktan – upalne promjene, alergija, toksično, mijaze
- Indirektno – biološki vektori uzročnika zaraznih bolesti

Artropodi

- Suzbijanje artropoda
- Insekticidi
- Larvicidi, adulticidi

Artropodi

Koljeno – 13 razreda

- Za čovjeka značajna 4:
- Eucrustacea – rakovi
- Diplopoda i Chilopoda – stonoge
- Arachnida – paučnjaci
- Insecta - kukci

Ušljivost

- Koljeno člankonošci, razred kukci ili insekti
- Životinjske vrste – 70%
- Uši – sitni kukci prilagođeni parazitizmu na krznu sisavaca
- Odvojeni spolovi
- Krila potpuno zakržljala
- Snažne nožice s jakim pandžama za veranje među dlakama
- Hrane se krvlju
- Trajno ostaju na nosiocu za koga su strogo specifični
- Adulti ne mogu preživjeti duže od 48 sati bez svog nosioca

Ušljivost

- Za čovjeka specifične dvije vrste
- Pediculus humanus – dvije odlike P. humanus var. capitis i P. humanus var. corporis
- Pediculus (Phthirius) pubis

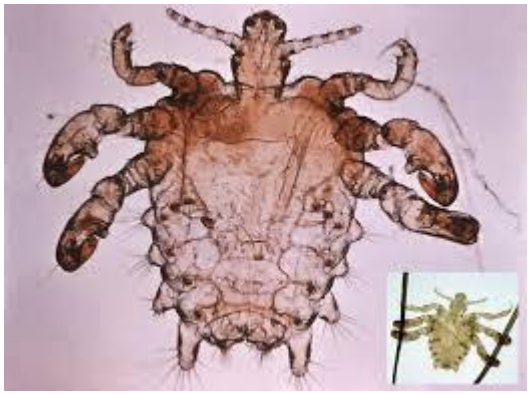


Table 1. Bacterial infections transmitted by body lice

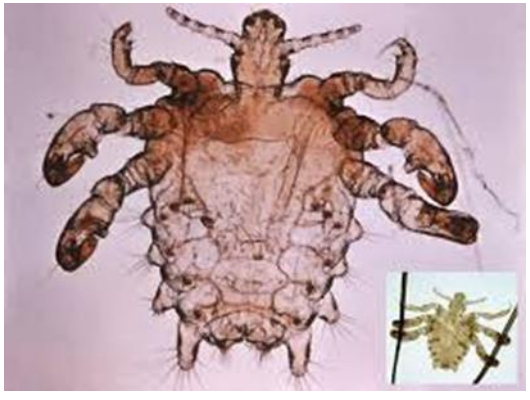
Disease name	Epidemic typhus, "jail fever"	Relapsing fever ("yellow fever")	Trench fever, quintan fever
Species of pathogen	*Rickettsia prowazekii*	*Borrelia recurrentis*	*Bartonella quintana*
Infection in lice	Gut, intestinal, generalized	Hemolymph	Gut, intestinal
Human contamination	Louse feces	Louse hemolymph	Louse feces
Disease in human relapse	Yes, one single late (Brill-Zinsser)	Yes, usually one, for ~2 days	Yes, usually several (quintan fever)
Chronic carriage	Yes	No	Yes
Reservoir	Human (+ sylvatic)	Human	Human
Fatality rate (without treatment)	30%	10%—40%	<1%
Treatment	Doxycycline, 200 mg once	Tetracycline	Doxycycline and gentamicin

Modified from Raoult and Roux (CID 29: 888-911, 1999)

IASR
Infectious Agents Surveillance Report

Pediculus (Phthirius) pubis

- Adulti 1-2 mm, smeđa
- Prijenos uglavnom spolnim putem
- Primarno živi na dlakama pubične regije



Pediculus (Phthirius) pubis

- Adulti 1-2 mm, smeđa
- Prijenos uglavnom spolnim putem
- Primarno živi na dlakama pubične regije
- Rjeđe – pazuha, obrve i trepavice, brkovi, brada, abdomen i drugi dlakom pokriveni dijelovi tijela
- Životni ciklus jaje- adult 17-25 dana

Pediculus (Phthirius) pubis

- Papillon d’amour
- Svrbež zahvaćene regije, najintenzivniji u pubičnom dijelu tijela
- Ekskorijacije i male (0.5-1cm) plavkaste makule, ingvinalna limfadenopatija
- Smeđe crveni izmet – uz bazu dlake, ekskorijacije ili na donjem rublju

Pediculus (Phthirius) pubis

Dijagnostika

- Nalaz uši ili gnjida na dlakama
- Korištenje povećala
- Woodova svjetiljka – fluorescenca vijabilnih gnjida

Pediculus (Phthirius) pubis

- Malathion 0.5%
- Permethrin 1%
- Phenothrin 0.2%
- Carbaryl 0.5-1%
- Lindan 1%
- Druga aplikacija nakon 7-10 dana
- Ivermectin tablete -1 tableta, druga nakon 10 dana
- Obrve,trepavice-vazelinska mast
- Liječenje spolnih partnera
- Mrtve grinje ostaju pričvršćene za dlaku – uklanjanje češljanjem
- Rezistencija, trovanje organofosfornim insektidicidima

Svrab

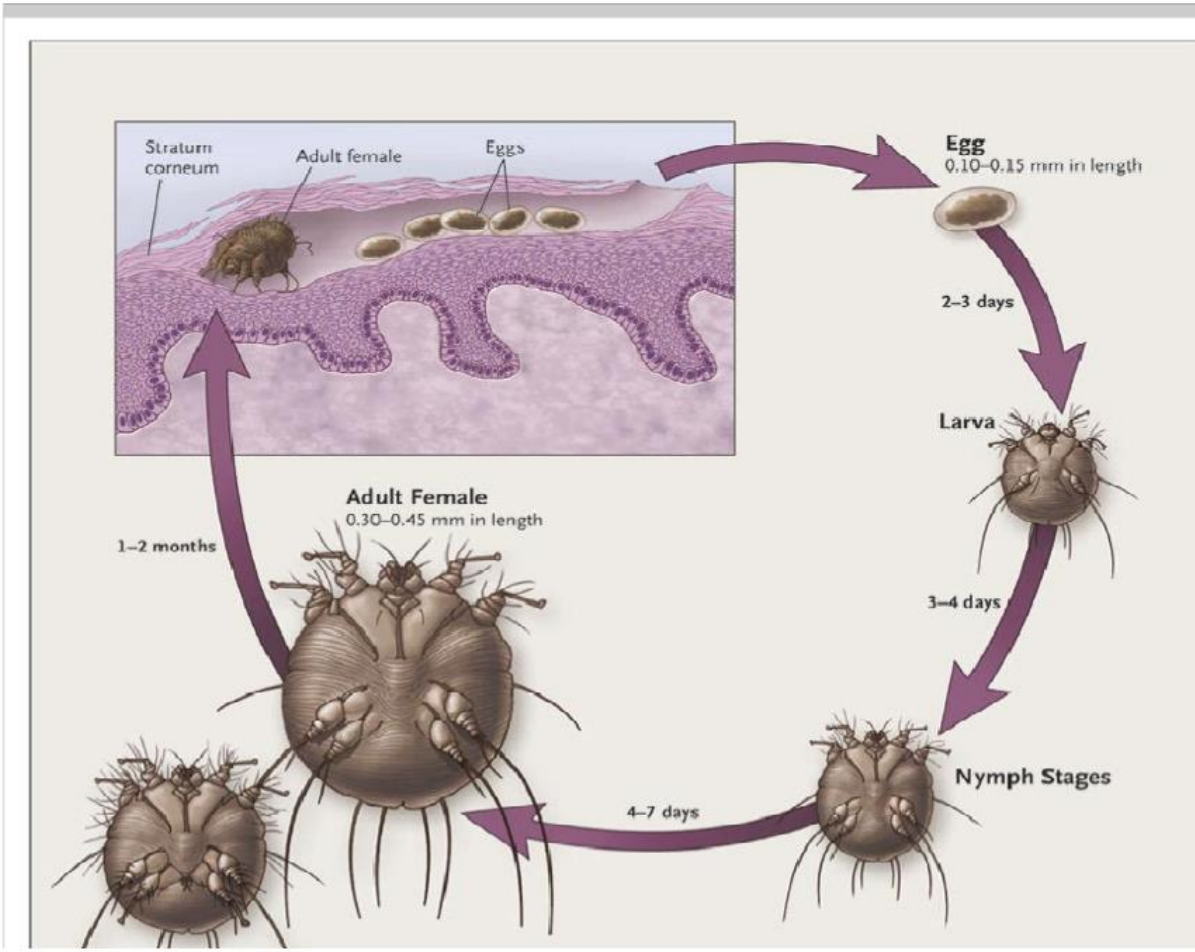
- Infestacija grinjom Sarcoptes scabiei var. hominis
- Životinjski svrab
  - – svrbež, upala, gubitak dlaka
  - – mačke, psi, svinje, konji
  - – fakultativni ektoparaziti kod ljudi
  - – samo ograničavajuća infekcija
  - - nema kompletnog životnog ciklusa
  - - čovjek „dead end” domaćin
  - - terapija se preporuča

Svrab

- Razred paučnjaci, red Acarina ili grinje
- Parazit površnih slojeva kože sisavaca
- Sitni (300-350 microm., okruglasta oblika, 4 para nogu)

Svrab

- Čeljustima kopa rov u epidermisu i hrani se keratinom
- Ženka živi 1-2 mjeseca dana i za to vrijeme polaže dnevno 3-4 jaja
- Jaje – ličinka – adult -11-22 dana
- Jače aktivan tijekom noći



Life Cycle of Scabies (SARCOPTES SCABIEI)

Svrab

- Epidemiologija
- Učestalost svijet – 300 mil. ljudi
- Češće -beskućnici, pacijenti u institucijama za ljude sa mentalnim poteškoćama, zatvorenici
- Prijenos – blizak dodir kože
- Moguć posredno – grinja do 7 dana na životu
- Širom svijeta, sve dobi, sve socioekonomske grupe
- Hiperendemski proširen u Subsaharskoj Africi, Indiji, kod Aboriđina

SPRIJEČITE EPIDEMIJU

SVE VIŠE SLUČAJEVA SVRABA U HRVATSKOJ: Ako uočite ove simptome, odmah se javite liječniku

11:48 29.11.2016 | Autor: Danas.hr | Foto: Tharakorn

Poveći broj slučajeva svraba zabilježen je ove godine u odnosu na dvije godine prije. Osobe koje uoče simptome odmah bi se trebale javiti liječniku kako bi se spriječilo širenje bolesti i pojava epidemije.

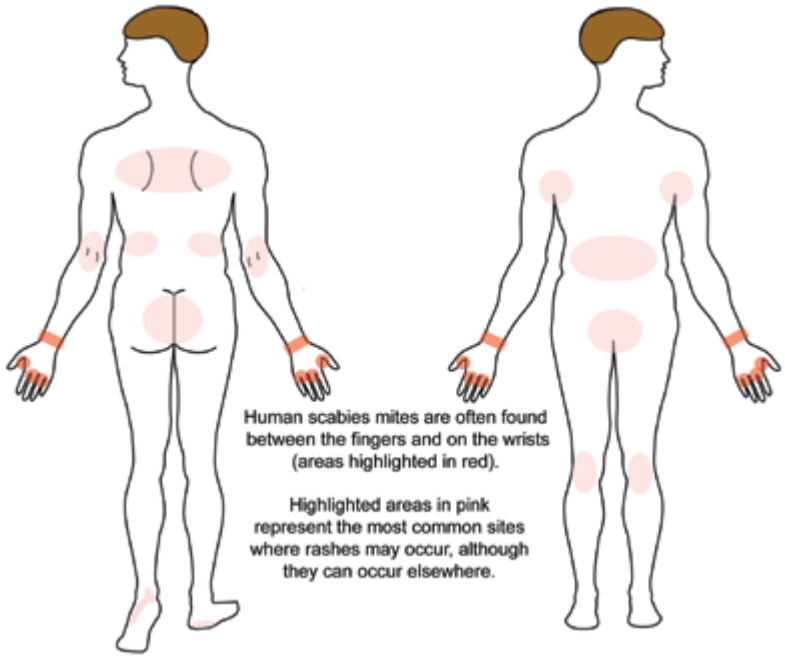
Broj slučajeva

Svrab

- Kliničke manifestacije
- Simptomi – primarna infekcija – 2-6 tjedana nakon infekcije
- Ponovna infekcija – nakon 1-4 dana

Svrab

- Kliničke manifestacije
- Tipični simptomi
- Generalizirani, intenzivni noćni svrbež – interdigitalni prostor, poplitealna fosa, fleksorne strane zapešća, umbilikalno područje, genitalije,unutarnja strana bedara, dojke kod žena



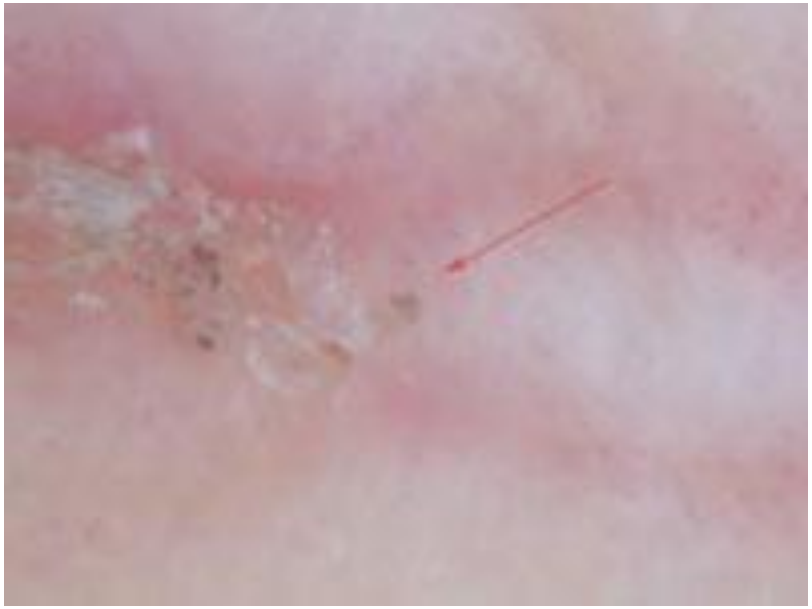
Svrab

- U umjerenoj klimatskoj zoni – lice i vlasište pošteđeno osim kod djece i starijih ljudi
- Sekundarna infekcija
- Koža – polimorfne promjene -2-3 mm papule i vezikule, ekskorijacije, kruste, kanalići, ponekad bule i urtike, indurirani upalni čvorovi – plastični infiltrati

Svrab

- Kliničke manifestacije
- Norveški svrab – krustozni – iznimno kontagiozan oblik
- Na koži tisuće grinja
- Svrbež odsutan ili minimalan
- Obično zahvaća i vlasište
- Imunodeficijencija, malnutricija, visoka životna dob, neurološka bolest

Svrab



- Dijagnostika
- Dermatoskopija
- Mikroskopija
- Biopsija kože

Svrab

- Terapija

Aktivna komponenta	Doziranje	Sigurnosni profil	Kontraindikacije
5% permethrin (krema)	Aplikacija od vrata na niže; ispiranje 8-14 sati nakon; rezidualna aktivnost, druga aplikacija nakon tjedan dana	Odličan; bockanje i svrbež kod aplikacije	Poznata alergija na lijek; novorođenčad mlađa od 2 mjeseca, dojenje
1% lindan (losion ili krema)	Aplikacija od vrata na niže; ispiranje 8-14 sati nakon; nema rezidualne aktivnosti,ponoviti nakon tjedan dana	Organofosforni insekticid, CNS toksičnost	Epilepsija, novorođenčad mlađa od 6 mjeseci, trudnoća, dojenje
10 krotamiton (krema ili losion)	Aplikacija od vrata na niže tijekom dva dana, ispiranje 24 sata nakon druge aplikacije	Odličan, ne pretjerano efikasan	Nema
2-10% sumpor u vazelinu premaz	Aplikacija 2-3 dana , ispiranje	Odličan, ne pretjerano efikasan	Alergija na sumpor
10-25% benzoil benzoat (losion)	Dvije aplikacije, sa jedno dnevnim i jedno tjednim razmakom	Iritans	Ekzem
0.5 % malathion (losion)	95% ovicidan, brzo ubijanje – 5 min., otporost	Zapaljiv, organofosforni insekticid	Novorođenčad mlađa od 6 mjeseci, trudnoća, dojenje
Ivermektin	200 microgr/kg jedna PO doza, ponavljanje za 14 dana	Odličan, mučnina, povraćanje	Sigurnost u trudnoći nepoznata, ne preporuča se djeci lakšoj od 15 kg

Comparative efficacy and safety of topical permethrin, topical ivermectin, and oral ivermectin in patients of uncomplicated scabies.

Chhaiya SB[1], Patel VJ, Dave JN, Mehta DS, Shah HA.

Author information

Abstract

BACKGROUND: Ivermectin has opened a new era in the management of scabies as orally effective drug. However, topical route has been little explored for ivermectin.

AIMS: To compare the efficacy and safety of topical permethrin, oral ivermectin, and topical ivermectin in the treatment of uncomplicated scabies.

METHODS: This was an open-label, randomized, comparative, parallel clinical trial conducted in 315 patients, randomly allocated to 3 groups. First group received permethrin 5% cream as single application, second group received tablet ivermectin 200 mcg/kg as single dose, and third group received ivermectin 1% lotion as single application. All the patients received anti-histaminic for pruritus. The patients were followed up at intervals of 1, 2, 3, and 4 weeks. If there were no signs of cure, the same intervention was repeated at each follow up. Primary efficacy variable was clinical cure of lesions. Statistical analysis was done by chi square test and one way ANOVA test using SPSS version 12.

RESULTS: At the end of first week, cure rate was 74.8% in permethrin group, 30% in oral ivermectin group, and 69.3% in topical ivermectin group ($P < 0.05$). At the end of second week, cure rate was 99% in permethrin group, 63% in oral ivermectin group, and 100% in topical ivermectin group ($P < 0.05$). At the end of third week, 100% cure rate was observed in permethrin and topical ivermectin group while 99% in oral ivermectin group ($P = 0.367$). No serious adverse events were observed.

CONCLUSIONS: Permethrin and topical ivermectin were equally effective against scabies while oral ivermectin was significantly less effective up to 2 weeks. Topical ivermectin can be used as an alternative to permethrin.

Scabies: molecular perspectives and therapeutic implications in the face of emerging drug resistance.
Mounsey KE[1], Holt DC, McCarthy J, Currie BJ, Walton SF.
Author information
Abstract
Limited effective treatments, coupled with recent observations of emerging drug resistance to oral ivermectin and 5% permethrin, raise concerns regarding the future control of scabies, especially in severe cases and in endemic areas where repeated community treatment programs are in place. There is consequently an urgent need to define molecular mechanisms of drug resistance in scabies mites and to develop and assess alternative therapeutic options, such as tea tree oil, in the event of increasing treatment failure. Molecular studies on scabies mites have, until recently, been restricted; however, recent advances are providing new insights into scabies mite biology and genetic mechanisms underlying drug resistance. These may assist in overcoming many of the current difficulties in monitoring treatment efficacy and allow the development of more sensitive tools for monitoring emerging resistance.

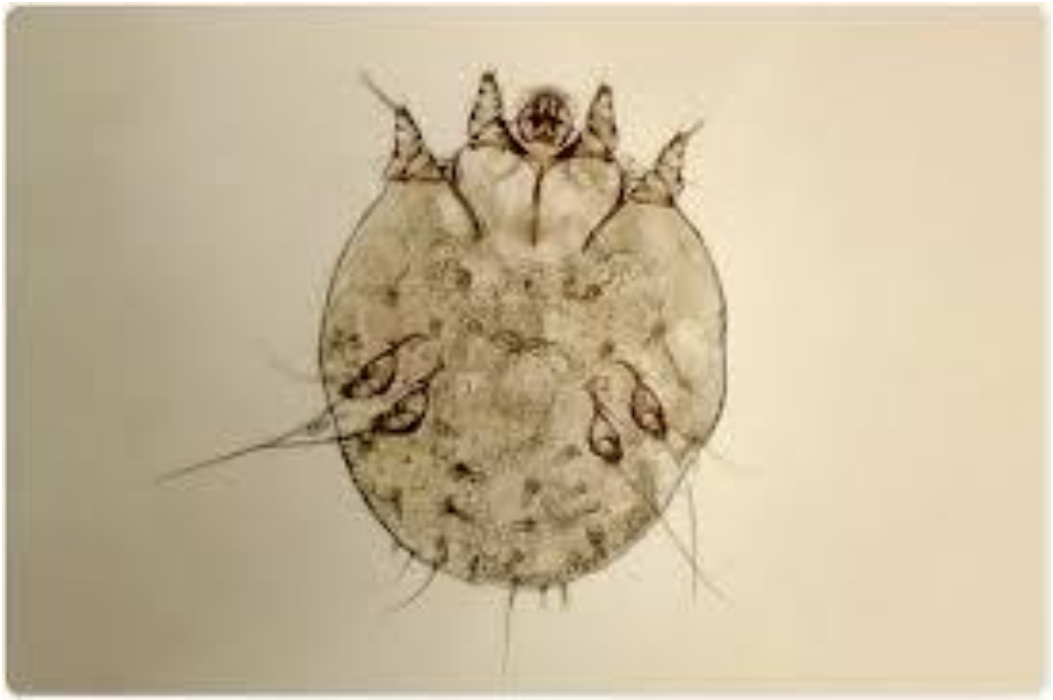
Scabies: molecular perspectives and

Svrab

- Indikacije za liječenje
- Karakteristični simptomi
- Visoko rizični kontakti – liječenje bez obzira na prisustvo simptoma
- Nisko rizičan kontakt –indirektan kontakt – jedino u slučaju krustoznog svraba
- Uputa izbjegavanje bliskog kontakta sa partnerima do kompletiranja liječenja
- „Traženje” seksualnih partnera unutar 6 tjedana od početka simptoma
- Detaljne informacije o liječenju najbolje na pismeno
- Trudnoća/dojenje – permethrin, benzil benzoat, sumporni preparati

Svrab

- Nakon terapije
- Svrbež može perzistirati nekoliko tjedana, osobito kod pacijenata sa atopijom
- Moguća mikroskopija uzorka i traženje grinje u preparatu – ne premoruča se



- Sarcoptes scabiei – gotovo okrugla do jajolika, kratkih nogu, zdepasta i kornjačasta. Tijelo zbijeno i prilagođeno kopanju po koži
- Žitna grinja-sitnija, izdzženija, duže noge

BD MAX™

sustav za molekularnu dijagnostiku

Performanse Učinkovitost Svestranost

BD MAX™ - Molekularna platforma po mjeri Vašeg laboratorija

Dr. sc. Denis Vadlja, Key Account Manager OEE

Waters™

Waters™

Waters™

Advanced Diagnostics

Formerly BD Diagnostic Solutions

This business has been acquired by Waters Corporation (“Waters”). Becton, Dickinson and Company or one of its affiliates or subsidiaries (“BD”) remains the legal manufacturer of Biosciences and Diagnostic Solutions products until all required regulatory transfers are completed. During this interim period, BD maintains full responsibility for all regulatory obligations of the legal manufacturer. Product information is supplied under BD’s regulatory authority. To learn more about the relationship between Waters and BD during this transition period, please see our detailed summary: www.waters.com/bdtransaction.

BD MAX™ sustav za molekularnu dijagnostiku

- **Potpuno automatizirana real-time PCR platforma** koja objedinjuje ekstrakciju, amplifikaciju i detekciju, uz širok portfelj validiranih IVD i open-system testova.

Manje od 1,5 min ručnog rada po uzorku

24 rezultata u prosjeku za 2,5 sata

96-120 uzoraka po smjeni (8 sati)

BD MAX™ sustav za molekularnu dijagnostiku

1. BD MAX™ analizator
2. All-In-One upravljački PC
3. Stalak za reagense i uzorke
4. BD MAX™ pakiranje testa

Sastav BD MAX™ pakiranja testova

- Pakiranje sadrži materijal i reagense za **24 testa**.
- **Liofilizirani reagensi** spremni za upotrebu.
- Pohrana na **sobnoj temperaturi**.

1. Tubice za uzorke – Sample buffer tubes
2. Traka s reagensima – Unitized Reagent Strip
3. Ekstrakcijski reagens
4. PCR mastermiks (jedan ili dva)
5. Probojni čepovi (ovisno o panelu)
6. Potrošni materijal za transport uzorka (eze, pipete)

BD MAX™ Sample buffer tubes – Tubice za uzorke

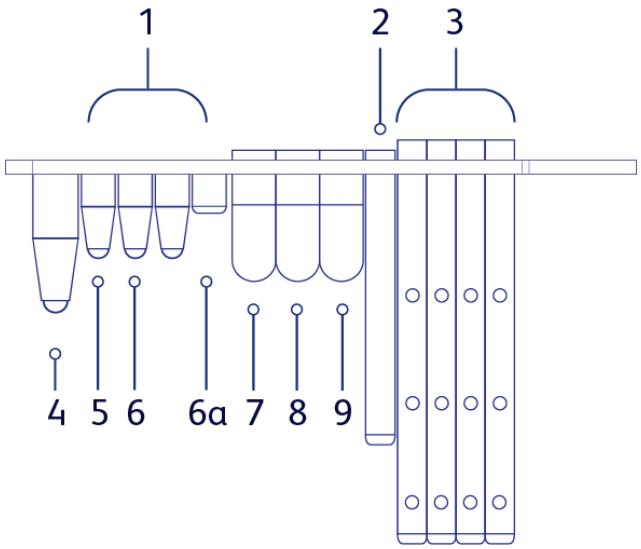
- **Pierceable Cap dizajn** – nema potrebe za zamjenom čepa tijekom pripreme ili pohrane uzoraka.
- **Samozatvarajući septum** – **sigurno rukovanje** s uzorcima nakon obrade. **Minimalna evaporacija** uzoraka uz **očuvanje kvalitete** uzoraka i do 5 dana na 2-8 °C.
- Brza, **izravna obrada uzoraka stolice** – **bez predtretmana** za bakterijske i virusne panele.
- **Optimiziran workflow za parazitologiju** – maksimalna pouzdanost i osjetljivost i kod kompleksnih uzoraka.
- Bris, LBC, aspirat, BAL, sputum, urin, stolica – i mnogo više.

Pojednostavite pripremu uzoraka i upravljanje otpadom

Waters™

Unitized Reagent Strips

1. Snap-in Tubes
2. Waste Reservoir
3. Pipette Tips
4. Lysis Tube
5. Extraction Tube
6. Master Mix 1
6a. Master Mix 2 if required
7. Wash Buffer
8. Elution Buffer
9. Neutralization Buffer



- Ekstrakcijski i PCR reagensi, zajedno s nastavcima za pipetiranje, integrirani su u **jedinstvenu traku s reagensima (Unitized Reagent Strip)**.
- Svi reagensi su stabilni na **sobnoj temperaturi**.
- Brza priprema uzoraka uz **manje od 1,5 minute praktičnog rada** po uzorku.
- Po zazavršetku analize, sav **otpad** iz procesa ekstrakcije **ostaje unutar trake** i može se zbrinuti u skladu s laboratorijskim standardima.

Provedba analiza po zaprimanju uzoraka u laboratorij, bez čekanja

- **Kombiniranje testova (Mix-and-Match)** za istovremenu **obradu različitih testova** unutar **istog radnog ciklusa**.
- **Ispreplitanje ciklusa** skraćuje vrijeme do rezultata.
- Od uzorka do rezultata za **2-3 sata**.
- Obrada do **120 uzoraka** unutar **8-satne smjene**.

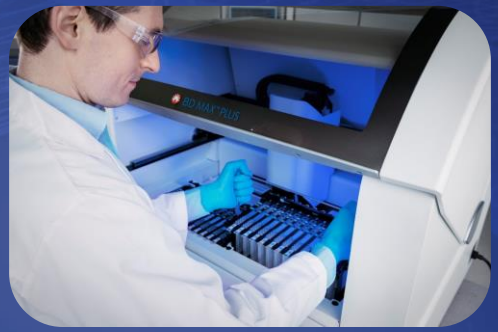
Ukupno 24 neovisne PCR reakcije na jednoj mikrofluidnoj kartici

- **Reakcijske komore se zagrijavaju neovisno jedna o drugoj** – različiti testovi s jedinstvenim temperaturnim profilima mogu se izvoditi zajedno.
- **Bez rizika od kontaminacije** – voštani ventili zatvaraju svaku komoru u kojoj se provodi PCR reakcija.
- **Interna kontrola** prati **kompletan postupak**, od prikupljanja uzorka, preko ekstrakcije do PCR-a.
- **Apsolutna iskoristivost** reagenasa i potrošnog materijala.

Pojednostavljen, učinkovit i optimiziran workflow

Snap

Sastavite trake s gotovim reagensima, pripremite uzorke i postavite ih na stalke.



Load

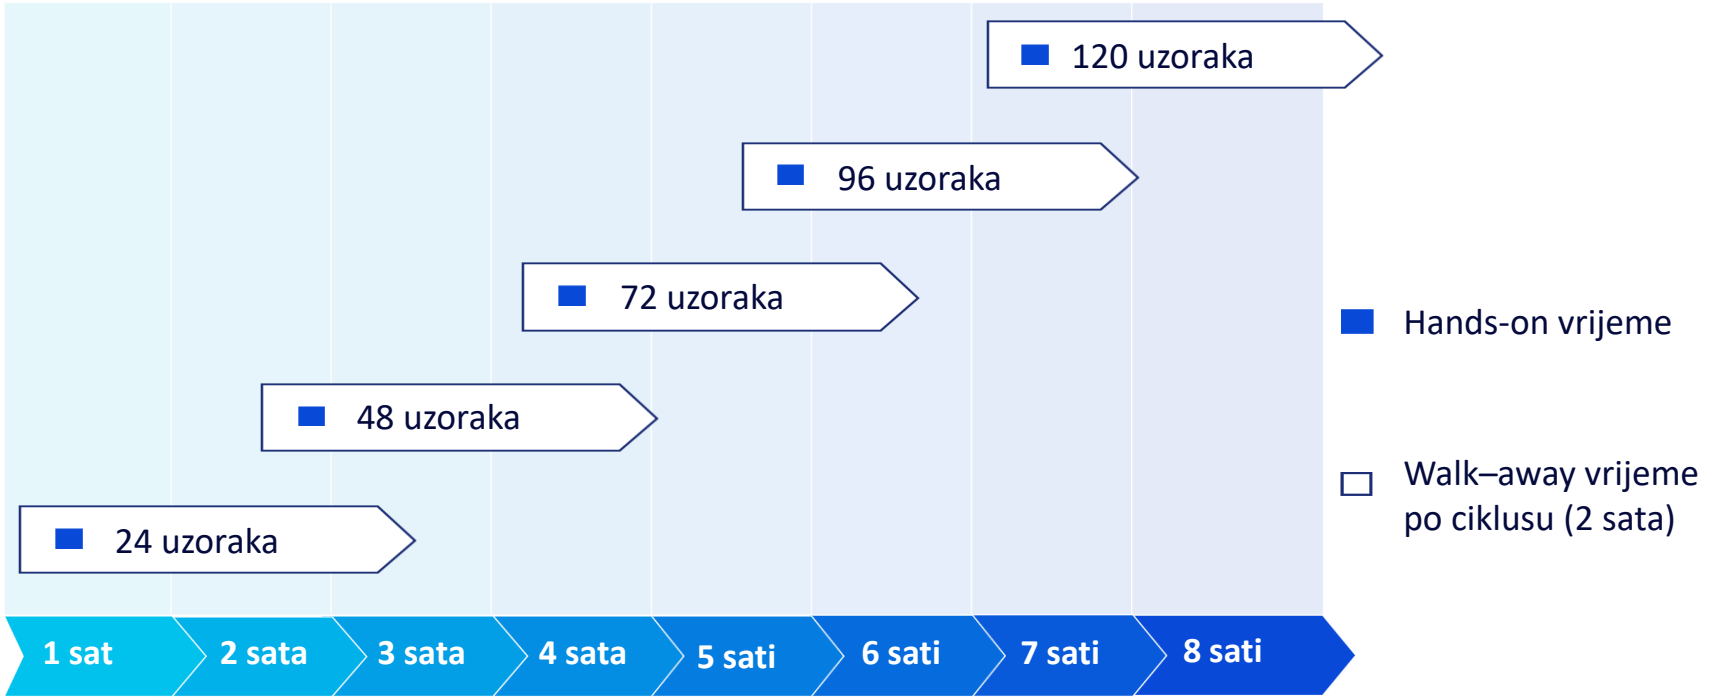
Postavite stalke s uzorcima i reagensima te PCR kartice na uređaj.

Go

Rezultate provjerite za 2–3 sata, ovisno o testu i broju uzoraka koje ste analizirali.

Pojednostavite i ubrzajte rad laboratorija uz fleksibilan workflow

- Izvođenje više testova u jednom runu — uz “walk-away” vrijeme za druge zadatke u laboratoriju.



Paneli za BD MAX™

- **BD (Becton Dickinson) – vlastiti CE-IVDR i FDA portfolio**
  - BD razvija i proizvodi vlastite testove za rutinsku dijagnostiku na BD MAX™ sustavu.

- **Partnerski paneli za proširenje portfelja**
  - BD MAX™ je otvorena platforma, pa značajan dio testova dolazi kroz sljedeće partnere:

1. **CerTest Biotec VIASURE CE-IVD paneli**
2. **BioGX partnerski CE-IVD i RUO paneli**
3. **Biolegio ReadyMax primarno RUO paneli**

- **Mogućnost razvoja vlastitog molekularnog testa na BD MAX™ sustavu.**

Sindromski portfolio na jednoj platformi

Bolničke infekcije i rezistencija

- ***C. difficile***
- **MRSA XT** i **StaphSR** (MRSA, mecA i mecC)
- **CPO** (KPC, NDM, OXA-48, VIM, IMP, GES), **colistin** (mcr-1) i **vankomicin** (vanA, vanB, vanC1, vanC2/3)

CNS infekcije i infekcije kod imunokompromitiranih pacijenata

- NSH i ELGBS **meningitis** paneli
- HSV-1, HSV-2, VZV **encefalitis** panel
- **Imunokompromitirani pacijenti** (EBV)

Sindromski portfolio na jednoj platformi

Waters™

- **Respiratorne infekcije**
  - **Osnovni virusni panel** (SARS-CoV-2, FluA, FluB, RSV)
  - **Prošireni virusni panel** (SARS-CoV-2, FluA, FluB, RSV, PIV, MPV, ADV, HCV)
  - **MDR-TB** (TB + rezistencije na RIF i INH) – ***WHO Guidelines***
  - **Ostale respiratorne infekcije** (*Bordetella*, *Pneumocystis*, atipične pneumonije)

- **Spolno prenosive infekcije i žensko zdravlje**
  - **Spolno prenosive infekcije i rezistencija** (CT/GC/TV i *Mycoplasma*/*Ureaplasma,* rezistencija na makrolide*)*
  - **Genitalne ulceracije** (*HSV-1*, *HSV-2*, *Treponema pallidum*, *Haemophilus*)
  - **Bakterijska vaginoza, vaginitis i kandidijaze**
  - **Screening u trudnoći** (Group B *Streptococcus)*

Sindromski portfolio na jednoj platformi

Waters™

💩 Gastrointestinalne infekcije (bakterije i virusi)

- **Osnovni bakterijski panel** (*Salmonella*, *Shigella*, EIEC, *Campylobacter*, STEC)
- **Prošireni bakterijski panel** (*Yersinia enterocolitica*, *Plesiomonas shigelloides*, *Vibrio* spp., ETEC)
- **Patotipovi *E. coli*** (O157, EHEC, EIEC, EPEC, ETEC i dr.)
- V**irusni panel** (NoV, RV, AdV, SaV, AstV)

▫ Gastrointestinalne (parazitske) infekcije - crijevni paraziti

- *Giardia lamblia / intestinalis*, *Entamoeba histolytica*, *Cryptosporidium parvum / hominis*, *Dientamoeba fragilis*, *Cyclospora cayetanensis*, Microsporidia (*Encephalitozoon*, *Enterocytozoon*)

🩸 Krvne (protozoarne) infekcije

- *Plasmodium* spp., *Plasmodium falciparum*, *Plasmodium vivax*
- *Babesia microti*

▫ Vektorske bakterijske infekcije

- *Anaplasma phagocytophilum*, *Ehrlichia* spp.
